Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
A-01	Assuming source temperature @20C for calculation.
HT1.3	Holding time exceeded. Sample was analyzed past the holding time.
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
MS1.0	Matrix spike recoveries exceed control limits.
MS1.2	Matrix spike recovery exceeds lower control limit. Reported results for parent matrix should be considered estimated due to matrix interferences.
MS2.0	MS/MSD RPD exceeds control limit. No material impact as both sets of recovery data meet control criteria.
Q-ME	Acceptable QC with marginal exceedance
R-02	The RPD was outside of QC acceptance limits due to possible matrix interference.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.
[CALC]	An automated calculation using unrounded values then rounding the final result (scientific rounding rules). Calculations do not contain direct qualifiers; please refer to the individual components of the calculation for any qualifiers
Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.	
All results are expressed on wet weight basis unless otherwise specified.	
All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.	
Hardness as CaCO ₃ , Total consist of the following components Magnesium, Total; and Calcium, Total

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/18/24 with the Chain-of-Custody document. The samples were received in good condition, at 12.5 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
O-05	The extraction for this analyte was performed outside of the EPA recommended holding time.
Q-ME	Acceptable QC with marginal exceedance
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/16/24 with the Chain-of-Custody document. The samples were received in good condition, at 13.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Source Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/16/24 with the Chain-of-Custody document. The samples were received in good condition, at 13.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
BS-04	The recovery of this analyte in LCS or LCSD was outside control limit. Sample was accepted based on the remaining LCS, LCSD or LCS-LL.
E-01	The concentration indicated for this analyte is an estimated value above the calibration range.
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
MS-05	The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
Q-02	Low recovery of this analyte in the QC sample. The analysis of the low level standard produced acceptable recovery indicating that the sample result might be accurately reported as Not Detected.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
U	Result not detected above the detection limit
%REC	Percent Recovery
Dil	Dilution
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/17/24 with the Chain-of-Custody document. The samples were received in good condition, at 13.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
BS-04	The recovery of this analyte in LCS or LCSD was outside control limit. Sample was accepted based on the remaining LCS, LCSD or LCS-LL.
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
O-05	The extraction for this analyte was performed outside of the EPA recommended holding time.
Q-02	Low recovery of this analyte in the QC sample. The analysis of the low level standard produced acceptable recovery indicating that the sample result might be accurately reported as Not Detected.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
U	Result not detected above the detection limit
%REC	Percent Recovery
Dil	Dilution
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/18/24 with the Chain-of-Custody document. The samples were received in good condition, at 12.5 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
BS-04	The recovery of this analyte in LCS or LCSD was outside control limit. Sample was accepted based on the remaining LCS, LCSD or LCS-LL.
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
Q-02	Low recovery of this analyte in the QC sample. The analysis of the low level standard produced acceptable recovery indicating that the sample result might be accurately reported as Not Detected.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
U	Result not detected above the detection limit
%REC	Percent Recovery
Dil	Dilution
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/18/24 with the Chain-of-Custody document. The samples were received in good condition, at 12.5 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
BS-04	The recovery of this analyte in LCS or LCSD was outside control limit. Sample was accepted based on the remaining LCS, LCSD or LCS-LL.
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
Q-02	Low recovery of this analyte in the QC sample. The analysis of the low level standard produced acceptable recovery indicating that the sample result might be accurately reported as Not Detected.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
U	Result not detected above the detection limit
%REC	Percent Recovery
Dil	Dilution
MDA	Minimum Detectable Activity
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

WECK LABORATORIES, INC.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/16/24 with the Chain-of-Custody document. The samples were received in good condition, at 13.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
%REC	Percent Recovery
Dil	Dilution
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Notes and Definitions

Item	Definition
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. The report may include analytes that are not currently accreditable by some state agencies or accrediting bodies. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 2/15/24 with the Chain-of-Custody document. The samples were received in good condition, at 2.2 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Brown and Caldwell - Los Angeles
 801 South Figueroa Street, Suite 950
 Los Angeles, CA 90017

Project Number: City of Santa Monica - Background Water Quality
Project Manager: Brown & Caldwell

Reported:
 05/13/2024 13:20

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
A-01	Calculation is based on source temperature @20C
HT1.0	Holding time exceeded. Sample was received at the lab past holding time.
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
MS1.0	Matrix spike recoveries exceed control limits.
MS1.2	Matrix spike recovery exceeds lower control limit. Reported results for parent matrix should be considered estimated due to matrix interferences.
O-09	This sample was received with the EPA recommended holding time expired.
O-15	The sample was received with the recommended holding time nearly expired. It was analyzed as soon as possible but the maximum holding time was slightly exceeded.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	Method Reporting Limit (MRL) is the minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.
[CALC]	An automated calculation using unrounded values then rounding the final result (scientific rounding rules). Calculations do not contain direct qualifiers; please refer to the individual components of the calculation for any qualifiers
Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.	
All results are expressed on wet weight basis unless otherwise specified.	
All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.	
Hardness as CaCO ₃ , Total consist of the following components Magnesium, Total; and Calcium, Total	

Weck Laboratories, Inc.

Analytical Laboratory Services - Since 1964

Proj. Name:	Olympic Well Field and Arcadia WTP Expansion	Project No.:	11200982
Contractor:	Walsh/BC	Date:	12/19/2023
Spec. Sect. #:	40 61 13	Dwg.:	
Submittal:	4006113-005 Transmitter Calibration Test Data		

Comments:

Action Taken:

- No Exceptions Taken Revise and Resubmit
- Make Corrections Noted Reject and Resubmit
- For Information Only

This review is only for general conformance with the design concept of the project and general compliance with the information given in the Contract Documents. Corrections or comments made on the shop drawings during this review do not relieve contractor from compliance with the requirements of the plans and specifications. Approval of a specific item shall not include approval of an assembly of which the item is a component. Contractor is responsible for: dimensions to be confirmed and correlated at the jobsite; information that pertains solely to the fabrication processes or to the means, methods, techniques, sequences and procedures of construction; coordination of his or her work with that of all other trades; and for performing all work in a safe and satisfactory manner.

Exhibit 6

Performance Parameters

EXHIBIT 6

ARCADIA WATER TREATMENT PLANT TESTING AND PERFORMANCE REQUIREMENTS

1 PURPOSE

The purpose of this document is to outline required start-up and commissioning plans, functional tests (pre-commissioning testing), acceptance tests, and system performance guarantees for the expanded Arcadia Water Treatment Plant (WTP). Testing requirements are specific to the following new and modified unit processes:

1. Ultraviolet Advanced Oxidation Process (UV-AOP)
2. Granular Activated Carbon (GAC) system
3. Flow Reversal Reverse Osmosis (RO)
4. Decarbonation Tower (or Air Stripping Tower)

The Design/Builder shall demonstrate that the Olympic Well Field Restoration and Arcadia Water Treatment Plant Expansion Project (Project) meets all Guaranteed Plant Performance Parameters (Section 6, below), which constitutes a performance guarantee. This document generally sets forth the requirements for Start-up and Commissioning, Acceptance Testing, and Performance Guarantees of the Project required under the Contract Documents. This document is intended to supplement the project technical specification requirements but take precedence over technical specification sections.

2 REGULATORY APPROVALS

The Design/Builder shall meet all applicable requirements set forth by Governmental Agencies, having jurisdiction over the Project as they relate to any testing and acceptance procedures and reporting protocols for the Arcadia WTP. Design/Builder shall obtain the following approvals:

- State Water Resources Control Board (SWRCB), Division of Drinking Water (DDW)
 - Drinking Water Permit Amendment
 - 97-005 Policy Memo/permit, including but not limited to the following documents to be submitted to DDW:
 - Step 4: Effective Treatment and Monitoring Report
 - Step 5: Human Health Risks Associated with Failure of Proposed Treatment Report
 - Final Engineering Report that addresses the design, multi-barrier treatment approach, and treatment goals.
 - An Operations and Maintenance Manual for the new treatment facilities
 - A Water Quality Monitoring Plan
 - Acceptance Test Plan and Final Acceptance Test Report(s) to demonstrate the performance of the new treatment processes.
 - These reports shall be provided in both PDF and MS Word formats.
- South Coast Air Quality Management District (SCAQMD)
 - Vapor-Phase GAC system permit amendments, if applicable
- City of Los Angeles Fire Department approvals
- City of Santa Monica Building Permits

3 START-UP AND COMMISSIONING PLAN

The Design/Builder shall submit a Start-Up and Commissioning Plan for approval by the City no later than six (6) months prior to starting Commissioning activities. The Design/Builder shall not start Commissioning activities without an approved Start-Up and Commissioning Plan. Refer to Specifications Section 01 45 20 for additional requirements.

The above referenced plans (collectively, "Plans") shall conform to the requirements of the Project Criteria, comply with the requirements outlined in this exhibit, and address the activities and Guaranteed Plant Performance Parameters for the Project and all equipment required to achieve the Project Criteria. For purposes herein, "Project Criteria" means: 1) restore the Olympic Sub-basin by pumping and treating the contaminated groundwater through a new advanced water treatment facility (approximately 2,000 gallons per minute of treatment capacity), 2) increase the treatment efficiency at the Arcadia Water Treatment Plant to 90 percent or greater and reduce waste discharge, 3) continue to provide City customers with a high-quality and safe drinking water supply, and 4) maximize local water supplies to reduce reliance on imported water supplies.

The Start-up and Commissioning Plan shall include, but not be limited to, the following:

- i. Schedule for mechanical and electrical completion, testing, and commissioning of equipment or system(s) applicable to the Project.
- ii. Scoped and approved piping and instrumentation diagrams ("P&IDs") identifying the limits of testing for each system and identifying all equipment, piping, instrumentation, and controls for each system.
- iii. Scoped and approved Single Line Diagrams showing the limits of testing and components of the electrical distribution system that will be required to be operational and active during the testing of the system components.
- iv. Approved point-to-point and loop drawings.
- v. Procedure/practice identifying the Design/Builder's plan for isolation of equipment prior, during, and after testing to assure the safety of the equipment, Design/Builder's personnel and its subcontractors, manufacturer's personnel, City employees, and others present. Procedure shall address as a minimum lockout/tagout and method of identifying status of equipment (construction, mechanically complete, in testing, energized/de-energized, etc.).
- vi. Roles and responsibilities of the Design-Build Start-up Manager; Design/Builder's testing, check-out, calibration, and other start-up personnel; Design/Builder's applicable Subcontractors; City Inspection, Operations and SCADA personnel; and Process Equipment Vendor personnel.
- vii. The Design/Builder shall provide and use forms for each stage of testing that include all test information for equipment and systems, including specified operational parameters. This includes providing forms for pressure or leakage testing and pre-operational check-out for all equipment.
- viii. Test procedure for equipment and systems.
 - a. Test procedures shall be prepared for each equipment and system installed by the Design/Builder.
 - b. The procedures shall be submitted at a minimum forty-five (45) days before testing activities begin.
 - c. The procedures shall be approved by City no less than fourteen (14) days before testing activities begin.

- d. The procedures shall include all test information to be collected, including specified operational parameters, during testing.
- ix. Calibration procedures.
- x. Sample calibration sheet for all types of instruments consistent with specifications.
- xi. Hydrotest test record form.
- xii. Electrical and Control sheets in accordance with specifications.
- xiii. Mechanical and electrical completion sign-off forms for each type of equipment installed by the Design/Builder on this contract.
- xiv. Start-up and Commissioning schedules; both to be included in the Construction Schedule (**Exhibit "3"** to the GMP Amendment).

3.1 START-UP AND COMMISSIONING

Refer to Specifications Section 01 45 20 for specific start-up and commissioning requirements. In general, start-up and commissioning activities shall consist of the following:

- i. Pressure and/or leakage tests.
- ii. Electrical testing as specified in Division 26.
- iii. Wiring and piping, individual component, loop, loop commissioning and tuning testing as described in Division 40.
- iv. Pre-operational checkout for all mechanical and HVAC equipment. Pre-operational check-out procedures shall be reviewed and approved by the respective equipment manufacturers.
- v. Initial operation tests of all mechanical, electrical, HVAC, and instrumentation equipment and systems to demonstrate compliance with the performance requirements of this project manual.

3.2 PRE-COMMISSIONING AND FUNCTIONAL TESTING

3.2.1 General

- i. The primary activities for pre-commissioning and functional testing are construction, factory testing, component testing, stand-alone equipment testing, and documentation. The intent is to test isolated equipment and components for mechanical and electrical functionality prior to the introduction of process fluids.
- ii. Once all components in a system have been tested individually and all required deliverables have been approved for that system, the Design/Builder may proceed to Functional Testing (Specifications Section 01 45 20) of that system.

3.2.2 Pre-commissioning Testing Requirements

- i. The Design/Builder shall verify installation in compliance with the Project Specifications and the manufacturer's installation instructions.
- ii. The Design/Builder shall perform required alignment, adjustment, lubrication, and all other steps required, for each item of equipment and systems furnished by the Design/Builder in accordance with the manufacturer's instructions, the equipment section, and sections referenced within the equipment section.
- iii. System Pressure and/or Leakage Tests in accordance with Project Specifications
- iv. Electrical and controls testing shall be successfully completed in accordance with Project Specifications.

- v. The Design/Builder shall provide mechanical and electrical completion sign-off forms for each item of equipment (as required) and systems installed by the Design/Builder. The forms will be used in the field by the Design/Builder and the City jointly, to verify that all steps required for mechanical and electrical completion have been performed. The Design/Builder shall not begin pre-operational check-out of equipment or systems until the Design/Builder's Design Professional (Brown and Caldwell) has reviewed and signed the mechanical and electrical completion sign-off forms for the equipment or system.
- vi. Installation and mechanical and electrical completion deficiency items shall be resolved to the satisfaction of the Design/Builder's Design Professional before preoperational check-out procedures are performed. A detailed list of corrective actions taken will be maintained by Design/Builder.
- vii. Pre-operation check-out shall be performed by the Design/Builder in a logical, stepwise sequence to ensure that all equipment has been properly serviced, aligned, connected, and adjusted prior to operation.
- viii. Pre-operation checkout procedures conducted by Design/Builder shall include, but not necessarily be limited to, the following:
 - a. Ring-out of all power, control, and monitoring and control circuits prior to connection.
 - b. Insulation resistance testing of all electrical equipment and cable.
 - c. Voltage check of all circuits.
 - d. Phase sequence check.
 - e. Pre-Connection alignment check of all connecting pipelines and machines.
 - f. Complete check-out, through simulated operating conditions, of all safety circuits and control interlocks.
 - g. Alignment of all motor and equipment shafts.
 - h. Manual rotation and/or movement of all moving parts to ensure freedom of movement.
 - i. Bump motor to confirm correct direction of rotation. Any anti-rotation device shall be removed prior to bumping motor.
 - j. Operation of motorized valves through complete open/close cycle with motor.
 - k. Confirmation that all valves are correctly orientated and in their correct operating mode.
 - l. All equipment and installation meet all Cal/OSHA requirements including, but not limited to, Process Safety Management.
- ix. Calibration
 - a. Before conducting the tests specified herein, the Design/Builder shall furnish the services of technicians knowledgeable of the process instrumentation, all special tools, calibration equipment, and labor to calibrate and test all Design/Builder-furnished process instruments and the control system. All test equipment shall be calibrated to a NIST Standard within 90 days of test.
 - b. All instruments, meters, flow control devices, and transmitters shall be calibrated to within manufacturer's specifications of accuracy. All status and alarm switches, transmitters, and indicators shall also be tested.

- c. During the tests, if one or more instrument readings are not within the specified calibration requirements, or the control system does not function as specified, adjustments or alterations shall be made by the Design/Builder as necessary to meet the intent of the specifications and the completion tests shall be repeated.
- x. Testing of Equipment
 - a. Once all affected equipment has been subjected to the required preoperational check-out and calibration procedures, individual equipment and systems shall be started, operated, and tested by the Design/Builder to determine whether the equipment and systems meet the requirements of the approved equipment operation procedures and specification requirements, including the entire operational range specified and required as a part of the Project Criteria (if operational range is available from the City). The equipment shall be operated by the Design/Builder for the period of time as defined in the approved procedures. Local control panel operation shall be confirmed during the associated equipment operational tests.
 - b. Once tests have been satisfactorily completed, all Design/Builder-furnished equipment shall be rechecked by the Design/Builder for proper alignment, loose connections, unusual movement, or other indications of improper operating characteristics. Any deficiencies shall be corrected to the complete satisfaction of the Design/Builder's Design Professional.
 - c. In the event that any item of installed equipment exhibits operating characteristics outside of the manufacturer's or the Design/Builder's technical specifications, it shall be disassembled, inspected, repaired, or removed from the site and replaced at no cost to the City, by the Design/Builder.

3.2.3 Pre-Commissioning Reports

Pre-Commissioning Testing includes completion and submittal of the following:

- i. All Factory Demonstration Test (FDT) Reports
- ii. All Pressure Test Reports
- iii. All Structures Leak Test Reports
- iv. All Mechanical Alignment Reports
- v. All Equipment Tested as Stand-Alone in Local / Manual Mode
- vi. All Loop Test Reports
- vii. All Conductivity and Megger Test Reports
- viii. All Instrumentation Calibration Reports
- ix. All Manufacturer's Certificates of Proper Installation (COPI)
- x. All Electrical Breaker Setting and Equip Check Out Reports
- xi. All PLC / HMI Programming Bench Tested
- xii. Draft Operator Training Plan Submitted
- xiii. Draft Standard Operating Procedures Submitted
- xiv. Draft O&M Manuals Submitted
- xv. Pre-Commissioning Report including CAR (Corrective Action Report)

3.3 COMMISSIONING TESTING REQUIREMENTS

3.3.1 GENERAL REQUIREMENTS

The following general requirements apply:

- i. The Design/Builder shall be responsible for the performance of all Design/Builder-furnished equipment in accordance with the Project Specifications.
- ii. The Design/Builder shall bear the cost of retesting work which fails to meet Guaranteed Plant Performance Parameters.

3.3.2 NOTICE OF COMMENCEMENT OF THE COMMISSIONING TESTS

The Design/Builder shall provide the City with at least fourteen (14) days prior written notice of the expected initiation of the Commissioning Tests. At least ten (10) days prior to the actual commencement of Acceptance Testing, the Design/Builder shall certify in writing that it is ready to begin Acceptance Testing in accordance with the Acceptance Test Plan and the Design Build Contract.

3.3.3 FUNCTIONAL TESTING REQUIREMENTS

The objective of the functional testing is to operate (Design/Builder with City Operations assistance) all WTP equipment to assess if the WTP equipment functions as stated in the control strategies. The process and mechanical equipment shall function without leaks, breakdowns, or failures for five (5) days straight. Process equipment and analyzers shall be inspected for calibration before the 5-day test.

The remaining PLC interlocks, control loops and alarms shall be checked before beginning the 5-day test. The 5-day test shall not start until all process equipment is installed and ready to test. Vendor system suppliers, manufacturers, and system integrators shall provide operational training prior to or during functional testing for Design/Builder and City staff.

3.3.4 FUNCTIONAL TESTING REPORT & CORRECTIONS

After completion of the 5-day test, the Design/Builder's Design Professional shall be provided the list of alarms, any mechanical or electrical failures and corresponding downtimes. Any system integration activities necessary to rectify those failures should be incorporated prior to the Acceptance Test.

3.3.5 CONDITIONS TO COMMENCEMENT OF THE ACCEPTANCE TESTS

The Design/Builder shall not commence the Acceptance Tests until the following events have occurred:

- i. The requirements of Pre-Commissioning and Functional Testing have been met and the City has approved the Acceptance Test plan
- ii. DDW has approved the Acceptance Test Plan proposed by the Design/Builder
- iii. The Design/Builder has submitted its personnel training program required by the Design Build Contract
- iv. The Design/Builder has certified that it has completed the Pre-Commissioning and Functional Testing requirements
- v. The Design/Builder shall have completed all startup and commissioning required by the Design Build Contract, including testing of equipment, subsystems, and structures required by the Design Build Contract and the Design Requirements

- vi. The Design/Builder shall have devised a method acceptable to the City and applicable Governmental and Regulatory Bodies, and complying with Applicable Law for:
 - a. Determining that effluent water quality is in compliance with all Applicable Laws; and
 - b. Disposing or retreating any water which is not in compliance with all Applicable Laws.

4 RO MEMBRANE BENEFICIAL OCCUPANCY

Upon completion of functional testing, and prior to acceptance testing per an approved Acceptance Test Plan, the Design/Builder shall operate the RO system in conventional RO mode (flow reversal mode disabled) at the current RO system recovery (82-83% recovery) to demonstrate that the new RO membranes are operating under applicable membrane warranty conditions and meeting all applicable performance requirements per Project specifications. The timing of when the new RO membranes are installed and duration that it would be operated under the current RO system recovery (82-83% recovery) in relation to when the Acceptance Testing will begin is the sole responsibility of the Design/Builder. The following data and activities shall be collected and undertaken during the Beneficial Occupancy demonstration:

- i. Raw water silt density index (SDI) testing
- ii. Baseline normalization calculations
- iii. Comparison of performance data to membrane projection models
- iv. Conduct conductivity profile to confirm the membrane elements are performing per specifications
- v. Determine system compliance with membrane warranty parameters:
 - a. Feedwater water quality
 - b. Feedwater SDI
 - c. Feed pressure
 - d. Interstage differential pressures

The Design/Builder shall troubleshoot the RO system (evaluate upstream feedwater quality issues, perform membrane pressure vessel conductivity profiles, check system controls, adjust operational setpoints, etc.) and repeat system tests if the membrane system fails to meet performance requirements. Upon successful completion of Beneficial Occupancy demonstration testing, the Design/Builder shall submit all testing data, which demonstrates RO membrane system performance compliance, and the membrane warranty period shall begin.

5 ACCEPTANCE TEST PLAN

The Design/Builder shall submit an Acceptance Test Plan for approval by the City, and to serve as part of the DDW permitting process, no later than six (6) months prior to commissioning activities. The City shall have fifteen (15) days to review and approve the Design/Builder's Acceptance Test Plan or return with comments, which will be responded to by the Design/Builder within ten (10) days. The Design/Builder shall not submit the final Acceptance Test Plan to DDW until it has been reviewed and approved by the City.

The Design/Builder shall prepare and submit to the City and DDW for its review and approval an Acceptance Test Plan that includes the following minimum requirements:

- i. UV/AOP performance test protocol, including spiking of 1,4 Dioxane and other constituents to demonstrate performance to the City and DDW. Refer to Specification Section 46 63 23 for validation testing requirements.
- ii. GAC system performance (backwash/bumping functionality, flow splitting, peroxide quenching, clean bed headloss, and EBCT compliance).
- iii. RO performance test protocol, including:
 - a. Raw water silt density index (SDI) testing
 - b. Conductivity profile testing
 - c. Baseline normalization calculations
 - d. System compliance with membrane warranty parameters (feedwater water quality, SDI, etc.)
- iv. Operations, Maintenance and Monitoring Plan (OMMP), as submitted to the City and DDW.
- v. Procedures for testing all new water treatment processes and ancillary support systems.
- vi. Procedures for testing standby power.
- vii. Use of permanent and temporary instrumentation.
- viii. Organization of the test team, including responsibilities, authority, and decision-making protocols.
- ix. Response procedures for unsuccessful test results including definition of threshold results that constitute overall Acceptance Test failure.
- x. Operating and maintenance schedule during testing.
- xi. Procedures for UV/AOP off-spec water disposal and system protections.
- xii. Procedures for RO system off-spec water disposal and system protections.
- xiii. Internal and external communications protocols.
- xiv. Acceptance Testing schedule.
- xv. Procedures for demonstrating compliance with every Acceptance Test Standard.
- xvi. Response or mitigation procedures in the event of an unsuccessful test event.

The Acceptance Test Plan shall describe methods for demonstrating compliance with Guaranteed Plant Performance Parameters, including:

- i. A list of all WTP influent water, inter-process (i.e. UV-AOP effluent, GAC effluent, RO Feed, RO permeate), and effluent water quality, performance parameters to be monitored and a schedule of monitoring. The monitoring description will include sampling locations, analytical methods and sampling frequencies at which water quality and parameters will be monitored on a continuous or other defined basis. Final sampling and performance requirements shall be approved by DDW. All water quality and performance parameters shall be sampled for and measured daily during the Initial 7-day DDW Acceptance test and at regular sampling intervals, per permitting requirements, during the 30-Day testing. Sampling for 1,4-dioxane should be across the entire water treatment train or as required by DDW.
- ii. Procedures for spiking contaminants (e.g., 1,4-Dioxane, TCE, and PCE) to test UV AOP system per Specification Section 46 63 23.

- iii. Identification of equipment calibrations to be performed, descriptions of all calibration techniques to be used and timing of calibrations relative to Acceptance Testing (all instruments, including benchtop units, used in Acceptance Testing operations and to monitor and evaluate Acceptance Testing shall be calibrated in accordance with manufacturer's requirements.), QA/QC procedures, including those to be utilized for all equipment used for testing and measuring different parameters within the treatment process and at contract laboratories.
- iv. Identification of QA/QC procedures, including, trip blanks and duplicates for samples sent to contract laboratories. The description shall address intermediate spot and cross checks, in addition to the formal calibration periods.
- v. A full description of any analytical methods and techniques that will be utilized to verify compliance with all Applicable Laws and Guaranteed Plant Performance Parameters. In addition, descriptions of how data collected will be compared with Guaranteed Plant Performance Parameters shall be provided and shall be in a manner that complies with City requirements and regulatory requirements including applicable data handling requirements of the DDW. Provide examples of any tools such as flow charts, check sheets or any other data presentation and evaluation techniques that will be utilized.
- vi. Compliance with all laboratory water quality testing and analysis.
- vii. A listing of all samples requested by the City and a protocol for delivering samples to the City for the City's own testing program should the City elect to have such a program during Acceptance Testing.
- viii. For RO membrane separation process, a description of membrane normalization calculations to verify performance stability.
- ix. A list of critical control points for the UV-AOP process to demonstrate required log removal credit and treatment performance.
- x. A full description of any analytical methods and techniques that will be used to verify compliance. In addition, descriptions of how data collected will be compared with performance parameters shall be provided and shall be in a manner that complies with City requirements and regulatory requirements including applicable data handling requirements of DDW.
- xi. Supervisory Control and Data Acquisition (SCADA) system monitoring and control functions.
- xii. A list of real-time data fields that will be provided to the City during Acceptance Testing.

The Acceptance Test Plan shall also specify the form and contents of the Acceptance Test Report and include specific, detailed sampling protocols to be used while conducting the Acceptance Tests. Preliminary tests may be conducted at the Design/Builder's expense; however, the results of such tests shall not be made part of the Acceptance Test Report.

The Acceptance Test Plan shall describe the Design/Builder's approach and details for meeting the requirements of this document.

The Acceptance Test Plan shall document how Acceptance Testing will demonstrate the ability of the Arcadia WTP to treat the design range of flow, temperature, and influent water quality.

Draft Standard Operating Procedures (SOP) shall be submitted prior to, or in conjunction with, the submittal of the Acceptance test plan for use during testing activities. Final SOPs shall be submitted to the City after Substantial Completion but prior to Final Completion.

5.1 ACCEPTANCE TESTING

Refer to Specifications Section 01 45 20 for specific acceptance test requirements, which will consist of the following:

- i. Initial 7-days DDW Acceptance - The Initial 7-days DDW Acceptance Test shall have a minimum duration of seven (7) consecutive days and shall demonstrate that all water treatment plant operations over the Initial 7-days DDW Acceptance Test period are in full and continuous compliance with the Guaranteed Plant Performance Parameters. It is expected that during the Initial 7-days DDW Acceptance test, the final treated water will NOT be sent into the potable water distribution system and will be disposed of to either the sanitary sewer system or storm drain unless directed otherwise by DDW. The Design/Builder shall be responsible for providing all necessary temporary measures required to discharge the final treated water to either the sanitary sewer system or storm drain, or as directed by DDW. The operational testing period shall be for a period of seven (7) consecutive days at a minimum of half plant capacity (i.e., only two RO trains in operation) for the first two days and full plant capacity thereafter with a plan to alternate RO train operation, as needed, to test all RO trains and the UV-AOP system).
 - a. Design/Builder may reduce the duration of the Initial 7-days DDW Acceptance test, if allowed by DDW, to reduce the volume of water discharged to the sewer.
 - b. If the Initial 7-Days DDW Acceptance test is suspended for a period of more than eight (8) hours, and if a DDW approval has not been achieved, the "continuous compliance" requirement shall not be satisfied, and the Initial 7-days DDW Acceptance test shall be restarted at Day 1 and re-run for the entire 7-day test period.
 - c. Loss of power at the Arcadia WTP does not constitute a requirement to repeat Initial 7-days DDW Acceptance test. In such event, the testing duration would be paused during the loss of power event and resume once power is restored.
 - d. Stoppage of testing by the City to address issues unrelated to the Project performance will constitute a pause in testing but not constitute a requirement to repeat Initial 7-days DDW Acceptance test.
 - e. City will provide certified operators to operate new treatment facilities, including UV-AOP, RO System, Decarbonator, GAC and the Booster Pump Station under the direction of Design Builder. The Design/Builder will provide operation direction to the City Operators after the loading of new RO system membranes. Once Substantial Completion is reached the City will be responsible for all operations of the facility. Initial acceptance test is complete once DDW has approved water quality test results and issues either an amended drinking water permit or temporary permit to discharge water into the distribution system.
 - f. Upon completion of the Initial 7-days DDW Acceptance test and approval granted by DDW, the Final 30-days Continuous Operation Acceptance period shall commence.
- ii. Final 30-days Continuous Operation Acceptance - Upon completion of the Initial 7-days DDW Acceptance test and approval has been granted by DDW to commence Final 30-days Continuous Operations, the City will provide certified operators to

operate the Arcadia Water Treatment Plant with direction from the Design/Builder at full plant capacity (i.e., all RO trains operating) for an additional 30 days. It is expected that during the Final 30-days Continuous Operation Acceptance test period, the treated water will be sent into the drinking water distribution system unless directed otherwise by DDW. The primary objective of the Final 30-day Continuous Operation Acceptance period is to verify performance of the treatment system and to transition operational direction from the Design/Builder to the Owner.

5.2 SUPPLEMENTAL TESTING

In addition to Acceptance Testing, supplemental testing is to be conducted.

- i. Supplemental 30-days Continuous Operation - Upon completion of the Final 30-days Continuous Operation Acceptance testing period, testing is to be continued for 30 additional days. The primary objective of the Supplemental 30-days Continuous Operation period is to verify performance of the treatment of the RO systems for a total of 60 days. If the RO system is unable to operate for a minimum of 60-days without a clean-in-place (CIP), Design/Builder shall evaluate operational data and make a recommendation on operational adjustments and repeat both the Final 30-days Continuous Operation Acceptance and Supplemental 30-day Continuous Operation test periods for the RO system. Any remedy or operational adjustments made shall be approved by the City prior to restart of the Final 30-days Continuous Operation Acceptance test. Failure of City operations staff to adhere to, or follow, Design-Build team directions for WTP operations, unexpected plant power failures, or the occurrence of well field upsets that introduce unexpected solids into the WTP, all of which may result in RO system fouling/scaling, shall not be the responsibility of the Design/Builder and shall not result in restarting the Final 30-days Continuous Operation Acceptance and Supplemental 30-day Continuous Operation testing periods.

5.3 ACCEPTANCE TEST REPORT

Within thirty (30) days following the last day of any Acceptance Testing, the Design/Builder shall furnish the City with two (2) copies of a written Acceptance Test report consistent with the requirements specified in this document, by the Design/Builder.

5.3.1 ACCEPTANCE TEST REPORTING REQUIREMENTS

The Acceptance Testing Report shall be prepared in accordance with the Acceptance Test Plan and include at a minimum:

- i. Confirmation by the testing lab and Engineer of Record that testing was conducted in accordance with the approved Acceptance Test Plan.
- ii. A certification of the results of the testing with respect to each of the Acceptance Test Standards. Each Acceptance Test Standard shall be addressed separately and the basis for the determination presented. This certification of the results of the testing shall include (a) a determination of the extent to which the Project complies with the applicable Contract Standards and requirements and (b) for each Guaranteed Plant Performance Parameter, a determination of the extent to which the Project complies with the Guaranteed Plant Performance Parameters.
- iii. All data measured and recorded during the tests including laboratory analyses, chemical consumption, instrument calibrations, pressures, and measurements.

- iv. A certification of the results of the testing with respect to the log removal value for 1,4-dioxane, TCE and PCE by the UV/AOP process.
- v. Certification of RO recovery performance and Arcadia WTP final potable water quality.
- vi. Record of equipment outages, failures, and preventative maintenance.
- vii. Summary of test results and conclusive evidence of compliance with all test requirements.
- viii. All calculations used in determining test results.
- ix. Any other data reasonably requested by the City to be included in such reports.
- x. All certifications shall be signed and sealed by an Engineer in responsible charge of the design employed by the Design/Builder.

5.3.2 ACCEPTANCE TEST STANDARDS

The ability of the Project to meet the following Acceptance Test Standards shall be demonstrated during Acceptance Testing:

- i. The Project operated properly with only the normal complement of employees included in the staffing related to collection and analysis of samples and other test data.
- ii. The Project can deliver Arcadia WTP treated water per the Guaranteed Plant Performance Parameters. For Guaranteed Plant Performance Parameters, the averaging period for the purposes of Acceptance Testing shall be the length of the Acceptance Test. The results of all samples taken during an Acceptance Test shall be reported and included in the calculation of reported averages or other evaluations applicable to determining compliance with Guaranteed Plant Performance Parameters.
- iii. The Project is compliant with all applicable Governmental Approvals at all times.
- iv. The Project operations are consistent with the Project Criteria.
- v. The Project operates with automated and computerized systems in full and continuous operation.

5.3.3 FAILURE OF THE ACCEPTANCE TEST

Failure to continuously demonstrate the Acceptance Test Standards during the period of the Acceptance Test as defined in Sections 5.1 shall constitute a failure of the Acceptance Test. Any failure of an Acceptance Test shall require (a) correction of those components or conditions that resulted in the failure, and (b) performance of a retest of the Acceptance Test after proper notification is provided to the City. Any failure to meet an Acceptance Test Standard during the Initial 7-days DDW Acceptance or Final 30-days Continuous Operations testing periods shall require a repeat of the Initial 7-days DDW Acceptance or Final 30-days Continuous Operations Acceptance testing periods. Corrective actions and/or remedies to the failure shall be approved by the City prior to repeating the Initial 7-days DDW Acceptance or Final 30-days Continuous Operations Acceptance testing periods.

5.3.4 ACCEPTANCE TEST COMPLETION

Completion of the Acceptance Test shall be defined as completion of Acceptance Testing followed by submission by the Design/Builder and acceptance by the City of an Acceptance Test report demonstrating compliance with all acceptance test standards.

6 GUARANTEED PLANT PERFORMANCE PARAMETERS

The expansion of the Arcadia WTP includes the retrofit of existing RO trains with flow reversal technology and the incorporation of an UV-AOP system for the treatment of contaminants from the Olympic wells. The following sections summarize performance requirements for these two processes during acceptance testing.

6.1 UV-AOP SYSTEM PERFORMANCE GUARANTEE

The UV-AOP System includes a UV reactor(s) and hydrogen peroxide chemical feed system in addition to downstream GAC for hydrogen peroxide quenching. The proposed TrojanUVFlex UV-AOP System will treat Olympic wellfield water for 1,4-dioxane (primary treatment requirement) per the UV-AOP performance requirements, summarized in Table 1, in addition to other VOCs listed in Table 2. Not all constituents will be reduced by the oxidation process.

Table 1. UV-AOP System Performance Criteria		
Parameter	Unit	Value
Design feed water 1,4-dioxane concentration	µg/L	54
Design treated water 1,4-dioxane concentration	µg/L	0.2
Design 1,4-dioxane removal	N/A	≥2.4 log
Design feed water TCE concentration	µg/L	34
Design treated water TCE concentration	µg/L	0.2
Design TCE removal	N/A	≥2.2 log
Design feed water PCE concentration	µg/L	42
Design treated water PCE concentration	µg/L	0.2
Design PCE removal	N/A	≥2.3 log
Total flow		2,000 gpm
UVT		≥96%
UV system power (kW)		329
Hydrogen peroxide dose		≤40 mg/L

Sampling and testing of the raw water for the constituents and parameters listed in Table 1 will be accomplished at the frequencies and times required by DDW. Should the initial laboratory test results indicate any deviation from either the treatment or raw water quality objectives specified herein, the effluent and raw water will be retested to confirm the anomalies before any remedial actions are undertaken.

If water quality operating conditions fall outside of the parameters noted in Table 2, the Design/Builder shall take such steps as may be necessary to ensure that the 1,4-dioxane levels are below the applicable regulatory levels. Refer to Table 2 for UV-AOP baseline water quality parameters.

6.1.1 BASELINE WATER QUALITY PARAMETERS

Table 2 summarizes raw water quality in the Olympic source from the 97-005 Permit Step 2 report and the treatment objectives for inorganic contaminants. Given the variable nature of

source water quality, this data should be considered indicative of feed water quality to the process and that final treated water quality will meet all applicable drinking water standards after the entire treatment process.

Table 2. Olympic Well Water Quality – Step 2 Report					
Constituent [Units]	MCL or NL	Using UCL95 ^a		Using Production Well Concentration From 2020 ^b	
		Olympic Influent Concentrations Estimates	With Safety Factor Applied ^c	Olympic Influent Concentrations Estimates	With Safety Factor Applied ^c
1,1-Dichloroethane (1,1-DCA) [ug/L]	5	0.11	0.17	0.098	0.15

Trichloroethene (TCE) [ug/L]	5	8.2	12.3	23	34.5
Vinyl Chloride [ug/L]	0.5	0.028	0.042	ND	ND

a. From production wells concentration estimates

b. Maximum observed values from production wells from available 2020 sampling data

c. A safety factor of 1.5 was applied for each constituent, except for 1,2,3-TCP, which used a safety factor of 1.2.

6.1.2 GAC System Guarantees

The GAC system shall be guaranteed to operate at prescribed headloss conditions as outlined in Specification Section 44 31 16. The Design/Builder shall ensure that the GAC backwash/bumping system and flow control systems are operating per the design criteria. Specific performance guarantees include:

- i. GAC system effluent shall contain no measurable hydrogen peroxide residual based on a feed hydrogen peroxide concentration of less than or equal to 40 mg/L. Measurable Hydrogen Peroxide is defined as 0.5 ppm.
- ii. Empty Bed Contact Time (EBCT) shall be greater than 5 mins and loading rate shall not exceed 5.9 gpm/sf at the max design flow of 2.9 mgd.
- iii. Failure to meet effluent residual requirements will result in the Design/Builder adding additional media to each pressure vessel.

6.2 RO SYSTEM PERFORMANCE GUARANTEE

The Arcadia WTP expansion will include the retrofit of all four existing RO trains with ROTEC flow reversal RO technology to increase recovery for greater potable water production. The retrofitted skids shall be operated under the following conditions:

- i. Recovery:
 - a. Operating Range: 1,758 to 1,814 gpm of feed flow per train at 90 percent recovery
 - b. Minimum: 1,650 gpm of feed flow per train at 90 percent recovery
 - c. Maximum: 1,900 gpm of feed flow per train at 90 percent recovery
- ii. CIP Frequency shall be no more frequent than every 2 months. A CIP shall be triggered by any one of the following conditions:
 - a. Increase of normalized feed pressure $\geq 15\%$
 - b. Decline of normalized permeate flow rate $\geq 15\%$
 - c. Decline of normalized specific flux $\geq 15\%$
 - d. Increase of normalized salt passage $\geq 15\%$
- iii. Feed water quality parameters shall be as listed herein, with feed water pH adjusted with 93% weight per weight sulfuric acid and conditioned with antiscalant.
 - a. Feed water adjusted pH of 6.6 minimum
 - b. Antiscalant chemical addition shall be from one of the following:
 - 1) Avista Vitec-4000 = 3.5 mg/L maximum
 - 2) AWC A-119 = 1.2 mg/L maximum

Refer to Specifications Section 46 63 23, Reverse Osmosis Membrane System for additional RO system requirements, including membrane supplier requirements.

Feed water quality to the RO System shall be within reasonable values based on City's historical well water quality, dating from January 1, 2011, through the beginning of Acceptance Testing. Feed water quality to the RO System, prior to chemical pretreatment, measured during Acceptance Testing and Supplemental Testing exceeding the maximum values listed within Specifications Section 46 63 23 shall be reviewed and verified by the City. If verified, Design/Builder shall evaluate feed water quality data and make recommendations on operational adjustments to the RO system. Any remedy or operational adjustments requiring

restarting the Final 30-Day Continuous Operations Acceptance test period shall be approved by the City prior to restart of the Final 30-Day Continuous Operations Acceptance test.

Per Specification Section 46 63 23, after the completion of the installation and adjustment of the system, Design/Builder shall carry out on each individual part of the system and on the complete system such tests and in such number of test runs, as agreed in test procedures, to determine whether the system complies with the performance criteria.

6.2.1 Decarbonator System Guarantees

The new decarbonator system (third tower) shall be guaranteed to operate at prescribed headloss conditions as outlined in Specification Section 46 63 75. The Design/Builder shall ensure that the decarbonator is operating per the design criteria, including a maximum hydraulic loading rate of 29.6 gpm/sf and a feed flow rate of 2,800 gpm. Specific performance guarantee includes:

- i. Decarbonator effluent carbon dioxide concentration shall be no greater than 12 mg/L.

The Design/Builder shall measure the total VOC load exiting the entire decarbonator system at full WTP flow (after acceptance testing) to determine if the South Coast AQMD permit for gas phase VOC treatment is still required (greater than 1 pound per day VOCs).

6.3 Arcadia WTP Guaranteed Plant Performance Parameters

Table 3 summarizes overall Arcadia WTP organics treated water quality requirements.

Table 3. Arcadia WTP Organic Treated Water Quality Performance Parameters				
Parameter	Proposed WTP Effluent Goal (µg/L)	MCL/NL (mg/L)	Treated Water Concentration Fraction of MCL/NL ^a	
			Initial	Ultimate
1,4-Dioxane	<0.5	0.001	0%	0%
TCE	<0.5	0.005	0%	0%
PCE	<0.5	0.005	0%	0%
1,2,3-TCP	No change	0.000005	0%	0%
1,1-DCE	<0.5	0.006	0%	0%
1,1-DCA	No change	0.005	0%	0%
Cis-1,2-DCE	<0.5	0.006	0%	0%
Carbon Tetrachloride	No change	0.005	0%	0%
PFOA [ng/L]	No change	5.1	0%	0%
1,1,2-Trichloroethane [µg/L]	No change	5	0%	0%
1,2-Dichloroethane [µg/L]	No change	0.5	0%	0%
Benzene [µg/L]	No change	1	0%	0%
Methyl tert-butyl ether (MTBE) [µg/L]	No change	13	0%	0%
trans-1,2-Dichloroethene [µg/L]	No change	10	0%	0%
Vinyl Chloride [µg/L]	No change	0.5	0%	0%

a. Values below the MDL or MRL are considered zero for calculation purposes

The overall Arcadia WTP shall meet design production based on the current available raw water supply at the time of Start-up and Commissioning. Table 4 summarizes overall Arcadia WTP inorganics treated water quality requirements. The treated water from the Arcadia WTP shall meet all federal and State of California drinking water standards (e.g., MCL, sMCL, and NL).

Table 4. Arcadia WTP Inorganic Treated Water Quality Performance Parameters		
	Average Treated Water Quality	NL, MCL, or sMCL
Flow, Ultimate (gpm)	7,030	-
pH	8.3	6.5-8.5
Temperature (°C)	20	-
Total Dissolved Solids (TDS) (mg/L)	367	500
Alkalinity (mg/L as CaCO ₃)	97	-
Hardness (mg/L as CaCO ₃)	165	-
Aluminum, Total (mg/L)	0.0014	0.2
Copper (mg/L)	ND	1.0
Barium (mg/L)	0.02	1.0
Calcium (mg/L)	39.3	-
Iron, Total (mg/L)	0.01	0.3 (dissolved)
Lead (mg/L)	ND	0.015
Magnesium, Total (mg/L)	16	-
Manganese (mg/L)	0.01	0.05
Potassium (mg/L)	0.85	-
Arsenic (mg/L)	ND	0.010
Chloride (mg/L)	37.8	250
Fluoride (mg/L)	0.10	2.0
Sulfate (mg/L)	101	250
Nitrate (mg/L as N)	0.1	10
Selenium (µg/L)	ND	0.05
Silica (mg/L)	12	-

System performance shall meet all individual unit process guarantees outlined within this document and shall result in a finished water quality that meets all applicable DDW drinking water standards:

- i. Inorganic chemicals in 22 CCR Table 64431-A(1) ≤ MCLs
- ii. Radionuclide chemicals in 22 CCR Tables 64442 and 64443 ≤ MCLs
- iii. Organic chemicals in 22 CCR 64444-A ≤ MCLs
- iv. Disinfection byproducts in 22 CFR Table 64533-A ≤ MCLs
- v. Lead and copper ≤ action levels per 22 CFR §64678

- vi. Secondary Drinking Water Standards 22 CCR Table 64449-A ≤ SMCLs
- vii. All compounds with notification levels (NL) should be monitored

Major treated water quality requirements are summarized in Table 5.

Table 5. Arcadia WTP Major Effluent Water Quality Performance Parameters			
Parameter^a	Target Value	Range	Units
pH	8.3	8.0 to 8.5	Units
TDS (Final Effluent)	400	350 to 500	mg/L

1 INTRODUCTION/BACKGROUND

The City of Santa Monica has installed an ultraviolet/hydrogen peroxide (UV/H₂O₂) advanced oxidation process (AOP) system at the Arcadia Water Treatment Plant. This system will provide treatment of groundwater from the Olympic well field for 1,4-dioxane, trichloroethylene (TCE) and tetrachloroethylene (PCE) contamination. The system consists of two trains (1 duty+1 standby) of TrojanUVFlex200™ UV Advanced Oxidation Process (UV-AOP) chambers, along with a hydrogen peroxide (H₂O₂) dosing system. Each chamber contains 11 lamp sections, and each section is comprised of 24-1 kW Solo UV lamps.

Trojan Technologies, along with the Contractor (Walsh) and the designer (Brown and Caldwell), completed on-site performance testing of the UV-AOP system from September 22nd to October 5th, 2023. This report describes the methods, procedures and test conditions used during the performance testing and summarizes the test results based on the analytical data reported from third-party laboratories.

2 OBJECTIVES

The primary objective of TrojanUVFlex200 UV-AOP system performance testing was to verify that the installed UV system is capable of meeting the treatment criteria at the design operating conditions, as summarized in Table 2-1. A secondary objective was to provide a robust set of data demonstrating treatment up to 2.4, 2.2 and 2.3 log removal of 1,4-dioxane, TCE, and PCE, respectively, to determine the operating performance guidelines for review by the California Division of Drinking Water (DDW). The performance testing described herein is intended to provide data to demonstrate that the TrojanUVFlex200 automatic control program can control the system operation to reliably meet the contaminant treatment targets, not only at the design conditions, but also when the UVT is below the design value and when the flow per train is below the design value.

Table 2-1 summarizes the UV/H₂O₂ AOP system design criteria. The installed system includes two trains (1 duty + 1 standby) of single chamber TrojanUVFlex200™ reactors, each with 11 populated lamp sections (264 lamps per reactor). The one duty train will provide up to 2.4 log reduction of 1,4-dioxane, 2.2 log reduction of TCE and 2.3 log reduction of PCE from 2,000 gpm of 96% UVT water with up to 40 mg/L H₂O₂.

Table 2-1: Summary of UV-AOP Design Conditions.

Total Flow, GPM	2,000
Duty/Redundant Trains	1/1

PCE Effluent concentration (ug/L)	0.2
PCE Log ₁₀ Reduction	≥2.3
Nitrate Concentration (mg/L as N)	8.0
Minimum UV Transmittance at 254 nm, %	96
Design Hydroxyl Radical Scavenging Demand (s ⁻¹)	130,000
Design Maximum Influent [H ₂ O ₂] (mg/L)	40

3 UV-OXIDATION FUNDAMENTALS

3.1 TREATMENT MECHANISMS

UV light-based advanced oxidation processes (UV-AOPs) rely upon the simultaneous mechanisms of direct UV photolysis and hydroxyl radical-induced oxidation to degrade chemical contaminants in water. UV-photolysis is the process by which chemical bonds in the contaminant structures are broken by the energy associated with the UV light absorbed by those compounds. UV-photolysis does *not* require the addition of H₂O₂. A UV-AOP process in the presence of an oxidant (*e.g.*, H₂O₂) relies on the *in-situ* generation of hydroxyl radicals (•OH) through the UV-photolysis of H₂O₂ which is dosed to the water, and the subsequent oxidation of chemical contaminants initiated by hydroxyl radicals.

Hydrogen peroxide is commercially available as aqueous solutions of varying strength. It is a relatively weak absorber of UV light having a molar absorption coefficient at 254 nm of 19.6 L mol⁻¹ cm⁻¹. Nevertheless, the quantum yield of hydroxyl radical formation from hydrogen peroxide UV photolysis approaches unity. Therefore, the UV/H₂O₂ process is one of the most efficient advanced oxidation processes.

Hydroxyl radicals are extremely reactive, short lived and unselective transient species. Due to their high reactivity in natural waters, especially in the presence of naturally occurring organic matter (NOM) and alkalinity, these radicals will instantly react with the water constituents and do not exist beyond the boundaries of the UV reactor volume.

Hydroxyl radicals can oxidize organic and inorganic compounds by various types of reactions, comprising electron transfer, hydrogen abstraction and electrophilic addition reactions. In UV oxidation treatment processes, the yield of hydroxyl radicals is optimized based on the H₂O₂ required for a given contaminant treatment level for a given water quality, flow, and UV system operating conditions.

3.2 WATER QUALITY PARAMETERS

UV Transmittance

UV transmittance (UVT) is the spectral radiant power (P_{λ}) transmitted through a medium (*e.g.*, water sample) across a particular pathlength (l) divided by the spectral radiant power incident on the sample (P_{λ}^0). UVT is measured using a UV spectrophotometer. Reagent grade water is used to zero the instrument (*i.e.*, UVT = 100%). UV absorbance (A) at a given wavelength (λ) correlates to the amount of light absorbed by a solution over a given pathlength (l). UVT and UV absorbance are related through the following equation:

$$UVT(\lambda, \%) = 10^{-A(\lambda)} \times 100$$

The typical cell pathlength is 1 cm and both transmittance and absorbance values are commonly reported per cm. A key reference wavelength and one at which UVT is often reported is 254 nm, which is also the radiation emitted from the excited state of mercury atoms in the low-pressure mercury vapor arc lamps. UV Transmittance depends on the concentration of UV light-absorbing compounds and particles (which also scatter the light) present in the water matrix. The higher the water background UV absorption, the lower is the UV light availability to H₂O₂ for hydroxyl radical generation and to organic contaminants for the direct UV photolysis. The UV transmittance is one of the key water quality parameters used in the UV equipment sizing for a given application.

Hydroxyl Radical Scavenging Demand

While the desired reactions in UV oxidation processes are between photo-generated hydroxyl radicals and contaminant molecules, the non-selective nature and high reactivity of hydroxyl radicals result in reactions between these species and various organic and inorganic water constituents, which always occur at much higher concentrations than the target micropollutants. Examples of such hydroxyl radical scavengers are the dissolved natural organic matter (NOM), carbonate and/or bicarbonate ions, iron and manganese ions, etc. Hydrogen peroxide itself reacts with hydroxyl radical; thus, the kinetic model used to determine the UV/H₂O₂ process conditions and to size the UV equipment optimizes the H₂O₂ concentration required to generate the highest •OH yield, while affecting a minimum •OH demand. The •OH water background demand has a negative impact on the steady-state concentration of hydroxyl radicals in the

water. Since the rate of contaminant degradation is proportional to the steady-state concentration of hydroxyl radicals, these hydroxyl radical scavenging reactions reduce the rate of contaminant degradation. The •OH water background demand (also known as ‘scavenging term’; $\sum k_s[S]$ or S.T.) is water matrix-specific and must be determined experimentally through a properly developed and validated method. Trojan routinely determines the scavenging demand of water samples at its laboratory in London, Ontario. The •OH water background demand is another key water quality parameter used by the kinetic model for sizing the UV equipment for a given UV/H₂O₂ AOP application.

In principle, the method for the •OH water background demand relies on the competition kinetics for the hydroxyl radicals between the water matrix constituents and a probe compound which is added to the sample (Zhou and Mopper, 1996; Rosenfeldt and Linden, 2007; Rosenfeldt, 2010; Lee and von Gunten, 2010; Keen *et al.*, 2014; Kwon *et al.*, 2014; Gerrity *et al.*, 2016; Wang *et al.*, 2020). The most used probe compound is para-chlorobenzoic acid (pCBA) providing its well characterized rate constant for the OH radical reaction ($5.0 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$; Buxton *et al.*, 1988) and known quantum yield and molar absorption coefficient at 254 nm. Upon reviewing the literature published over the years and extensive use of pCBA for quantification of OH radical steady state concentration, Trojan adopted and used pCBA as a probe for the •OH water background demand determination in samples collected from water treatment plants in the past.

In a recent article, Kim *et al.* (2021) reported for the first time in the literature on a potential unidentified reaction of pCBA in the UV/H₂O₂ process in addition to the known •OH- and direct photolysis-based degradation. The authors examined several chemical compounds of various structures as potential •OH chemical probes, among which, pCBA. The experimental data indicated that para-substituted benzoic acids, in particular, are vulnerable to attack by an unknown reactive species, leading to false quantification of •OH. As a result, the •OH water background demand measured using these probes, including pCBA, would be underestimated.

The authors postulated the triplet excited state of H₂O₂ as the reactive species responsible for the degradation of pCBA in addition to the •OH and direct photolysis pathways. Although there is no direct experimental evidence in the public domain on the decay of H₂O₂ excited states, Kim *et al.* advanced the idea of pCBA degradation *via* a H₂O₂ triplet state based on the observed pCBA byproducts containing the oxygen isotope (¹⁸O) atom when they used H₂¹⁸O₂.

Based on their experimental results, Kim *et al.* concluded that the impact of the reaction of (H₂O₂)* on the degradation kinetics of the •OH probe compound (*e.g.*, pCBA) would be more significant under the following conditions: (a) presence of high concentrations of •OH scavengers; (b) high concentration of H₂O₂ dosed to the water sample subject to •OH water background demand measurement; and (c) low concentration of dissolved oxygen. The higher the contribution of (H₂O₂)* to the kinetics of pCBA decay, the greater the underestimation of the •OH water background demand.

Providing the recent literature information and additional in-house investigation on pCBA suitability as a probe for the OH radical water matrix demand determination, Trojan decided not to use this compound as a probe anymore. Further proprietary research studies conducted

at Trojan resulted in adopting a reliable probe compound for OH radical water matrix demand. That compound has been used over the past 3-4 years.

Santa Monica Olympic wellfield water samples were submitted to Trojan in 2020 for determination of the hydroxyl radical scavenging demand and associated water quality parameters. The results are listed in Table 3-1, and they were all determined using pCBA as an •OH probe compound. The maximum value measured was for the SM-4 sample (90,400 s⁻¹). Nevertheless, this result measured using pCBA as the scavenging probe needed to be adjusted to the value believed to be more representative of the true value. Trojan has observed that this ratio can be up to 1.5 and therefore, the pCBA scavenging result was adjusted to a value of 130,000 s⁻¹ and this was the value used as the basis for the UV AOP system sizing and subsequently programmed into the UV system PLC during commissioning.

Note: The STs listed in the table were adjusted prior to design to correct for underestimated results based on use of pCBA as described above.

3.3 TROJAN UV/H₂O₂ SYSTEM CONTROLS

The operation of Trojan UV-Oxidation Systems for contaminant treatment is based on the calculation of an instantaneous contaminant log-reduction (LR) as a function of the fundamental contaminant kinetic parameters, system flow, UV transmittance, hydroxyl radical scavenging demand, H₂O₂ concentration and UV reactor intensity sensor values. The methodology is based on a contaminant treatment kinetic model that combines a fundamental photochemical kinetic model with an empirically validated UV dose model to accurately predict the degradation of contaminants in a UV-oxidation system (i.e., UV alone or combined with an oxidant to generate hydroxyl radicals).

Therefore, the UV system control algorithm provides a dynamically adjusted system based upon the identified process input parameters. These include flow rate, UVT, hydroxyl radical scavenging demand, and contaminant influent and target effluent concentration (to calculate target LRs). Further, by inputting the H₂O₂ and electrical energy costs, the algorithm calculates the combination of reactor power and H₂O₂ concentration that meets the contaminant treatment objective at the lowest operating cost. Specific constraints on the limits of the system operation can also constrain the operating conditions.

The fundamental photochemical kinetic model is based upon a contaminant-specific pseudo-first order UV fluence-based reaction rate constant (k', cm² /mJ) that accounts for contaminant

reduction due to both UV direct photolysis and hydroxyl radical oxidation. In addition to the contaminant-specific fundamental kinetic parameters (i.e., quantum yield (Φ_C), molar absorption coefficient (ϵ_C) & second order hydroxyl radical rate constant $k_{C,OH}$), this fluence-based rate constant k' is dependent upon the H_2O_2 concentration and the hydroxyl radical scavenging demand of the water ($\sum k_s[S]$ or S.T.). Typically, the scavenging demand of the water is considered to be either a constant value (based upon historical measurements) or linked to certain measurable water quality parameters. The H_2O_2 concentration is a control variable that can be monitored and adjusted together with the UV reduction equivalent dose (RED) to provide the target LR of the contaminant. The fluence-based rate constant for contaminant treatment with the UV/ H_2O_2 AOP is calculated using the following equation:

$$\frac{k_c}{I_{avg.}} = k'_c = \frac{\phi_c \epsilon_c LN(10)}{U} + \frac{LN(10)\phi_{OH}\epsilon_{H_2O_2}k_{c,OH}[H_2O_2]}{U(k_{H_2O_2,OH}[H_2O_2] + \sum k_{s,OH}[S])}$$

Eq. 1

where,

Symbol	Description
U	Photon energy at 253.7 nm (J/einstein)
ϕ_C	Quantum Yield of contaminant at 254 nm
ϕ_{OH}	Quantum Yield of OH radical formation from hydrogen peroxide photolysis
ϵ_C	Molar absorption coefficient of contaminant at 254 nm, $M^{-1} cm^{-1}$
$\epsilon_{H_2O_2}$	Molar absorption coefficient of hydrogen peroxide at 254 nm, $M^{-1} cm^{-1}$
$k_{C,OH}$	Reaction rate constant of contaminant with OH radical, $M^{-1} s^{-1}$
$k_{H_2O_2,OH}$	Reaction rate constant of H_2O_2 with OH radical, $M^{-1} s^{-1}$
$k_{s,OH}[S]$	Hydroxyl radical scavenging for various constituents S in the water matrix, s^{-1}

Equation 1 is provided and discussed further by Stefan (2018). Inspection of equation 1 shows that for a given contaminant and water quality (i.e., ($\sum k_s[S]$), the H_2O_2 concentration is the only independent variable.

This rate constant has the units cm^2 / mJ . The UV dose required to achieve 90% removal of a chemical pollutant (D_{10} , mJ/cm^2) is related to the fluence-based rate constant k'_c through equation (1):

$$D_{10} = Ln(10)/k'_c \quad \text{Eq. 2}$$

Therefore, for a given H_2O_2 concentration, a target LR (LR_t) is achieved by delivering the required UV dose i.e., the reduction equivalent dose (RED, mJ/cm^2).

$$RED_t = D_{10} \times LR_t \quad \text{Eq. 3}$$

The UV dose delivered by a UV reactor is a function of various parameters among which the water flow rate and UVT, the lamp power level, the quartz sleeve transmittance (including fouling) and the UV reactor efficiency. The flowrate and UVT are measured parameters. The lamp power level is the controlled/independent variable.

In disinfection applications, the RED for a UV reactor is calculated using a bioassay-generated validated equation in which RED is a function of UV lamp power level/UV intensity measurement, flowrate, UVT and D_{10} (i.e., the dose per log inactivation of a microorganism). Similarly, for UV-AOP applications, Trojan has developed a RED equation for the TrojanUVFlex200 reactor using an empirically validated computational fluid dynamics (CFD) model to relate RED to the UV intensity sensor values, flowrate, UVT, and contaminant D_{10} .

The control algorithm evaluates various combinations of lamp power and related RED and H_2O_2 dose and related D_{10} , all of which meet the contaminant LR target and selects that combination which represents the minimum operating cost.

4 METHOD

4.1 EXPERIMENTAL SET UP

UVT Modifier, Hydrogen Peroxide and Contaminant Dosing

To produce UV influent water quality that matches the design UVT value, Aqua Hume solution was injected into the 12-inch diameter greensand effluent pipe approximately 250 feet upstream of the UV reactors. A Blue-White peristaltic pump was used to inject diluted Aqua Hume at rates between about 9 ml/min to 250 ml/min. An injection wand was assembled that delivered the Aqua Hume solution into the center of the greensand effluent pipe.

The permanent H_2O_2 delivery system was used to inject H_2O_2 from the H_2O_2 storage tank containing 50% H_2O_2 into the 12-inch diameter UV influent pipe approximately 65 feet upstream of the reactors.

To quantitatively demonstrate the required log reduction targets of 1,4-dioxane, the 1,4-dioxane concentrations required in the UV influent were chosen such that the contaminant concentrations could be accurately measured in both UV influent and UV effluent samples. Therefore, the influent contaminant concentrations needed to be high enough to ensure that the 1,4-dioxane concentrations in the UV effluent samples would exceed the analytical method reporting limit (MRL). The analytical method employed for 1,4-dioxane analysis was EPA Method 522, which has an MRL of 0.070 $\mu\text{g/L}$ and an MDL of 0.028 $\mu\text{g/L}$. Since it was recommended to avoid working at concentrations approaching the MRL, a target UV effluent 1,4-dioxane concentration of 0.1 $\mu\text{g/L}$ was chosen.

The 1,4-dioxane injection stock was prepared by diluting between 6.2 grams and 146 grams of >99.5% pure 1,4-dioxane (Sigma Millipore #34857 batch #MKCQ8470) to 1.0 L with distilled water to prepare stock solutions ranging from 6,200 mg/L to 146,000 mg/L. These stocks were injected using a peristaltic pump into the UV influent piping adjacent to the Aqua Hume injection location described above.

Achievement of Steady State Operation

A critical requirement is that the UV system be operating at steady state prior to collection of the UV reactor influent-effluent sample pairs. A tracer test was performed to determine the time required for the system to reach steady state following a process change. The UVT modifier Aqua Hume (UAS of America), which is a liquid concentrate natural organic matter, was used as the tracer compound. A step change in the UVT was made and samples were collected at specified time intervals at both the reactor influent and effluent sample ports. The reactor lamps were off during this test. The samples were analyzed on-site for UVT to determine the time required for the system to reach steady state following a change in process conditions.

4.2 TEST PROCEDURE

The general procedure for each test completed was:

- Set and verify stable system flow at the target value.
- Begin injection of Aqua Hume (i.e., UVT modifier) and H₂O₂.
- Select the UV system control mode.
- Ensure that the correct ST is entered in the PLC.
- If local control is selected, turn on the desired number of lamp sections and set the lamp power level.
- If remote (i.e., auto) control is selected ensure that the correct contaminant log reduction targets are entered.
- Confirm that the target UV influent UVT and H₂O₂ dose is achieved.
- Confirm that the UV reactor operation is stable (i.e., number of lamp sections and power level).
- Begin injection of 1,4-dioxane stock solution.
- Wait for steady state time to elapse.
- Record the relevant data.
- Collect the influent and effluent sample pairs.
- Measure hydrogen peroxide and UVT in the UV influent and UV effluent grab samples.

Test Matrix

Table 4-1 presents the test matrix and summarizes the operational setpoints and predicted conditions as well as the notes describing the rationale for each specific test condition.

Near-ambient UVT (~98.5%) was tested as well as the design UVT of 96% and a minimum UVT target of 93%.

All tests were completed with combinations of wells SM-8 and SM-9 and using UV Train 2. Well SM-4 was not operational during the performance test. Whereas the test matrix states that UV Train 1 will be tested, an issue with the Train 1 outlet valve control resulted in the switch to test Train 2. The design and performance of the two parallel trains are considered to be identical, which is the basis for only testing one train. The first five tests, including two control tests, were to be performed in manual (i.e., local control) mode to ensure testing took place

under the conditions tied to the maximum power draw and peroxide dose set out in the contract documents. To conduct these tests in manual mode, the number of lamp sections operating, lamp power and H₂O₂ dose were manually set to the specified values. Tests 1, 2 and 3 were all performed at a BPL of 84% to simulate end of lamp life and sleeve fouling design conditions.

The two control tests were performed to demonstrate the expected result that no 1,4-dioxane treatment is achieved in the absence of both UV and H₂O₂ and that reduction of PCE and especially TCE is minimal by direct UV photolysis only (i.e., in the absence of H₂O₂). The tests were also included to assess the integrity of sample collection, handling, and analytical quality control.

Tests 4, 5 and 6 were performed in automatic control mode at the design flow and design LR target of 2.4 LR 1,4-dioxane, 2.2 LR TCE and 2.3 LR PCE. Test 4 is at the design UVT of 96%, test 5 is at 93% UVT and test 6 is at ambient UVT. These tests will demonstrate the ability of the system controls to respond to water quality changes. Tests 7 and 8 targeted a lower 1,4-dioxane LR (i.e., 1.2 log) with the design ST (130,000 s⁻¹) and measured ST (124,000 s⁻¹) entered into the UV PLC. Test 9 is a duplicate of test 6 but at the lower flow of 1,500 gpm. Tests 10 through 13 were conducted at 1,000 gpm each and show the impact of well blend. Tests 10 and 11 were performed with SM-9 only while tests 12 and 13 were performed with well SM-8 only. The paired tests utilize the design and measured ST values. Tests 14 and 15 are duplicate tests that targeted a lower 1,4-dioxane LR (i.e., 1.2 log) from water with a reduced pH (i.e., 6.5). Tests 16 and 17 are duplicates of test 6 but with a lower 1,4-dioxane LR (i.e., 1.8 log) and with the design and measured ST values entered in the PLC. Tests 18, 19 and 20 were performed with low pH water (i.e., 6.5). Tests 18 and 19 were performed at the ambient UVT and design UVT (96%) respectively and at the design flow and ST. Test 20 was performed at the ambient UVT, design flow and measured ST.

Sample Handling

Sample bottles were provided by Weck Laboratories Inc. (Industry, CA) for 1,4-dioxane, VOC and typical water quality parameter analyses. UV influent samples were collected first followed by the UV effluent samples, ensuring the steady-state operating conditions upon any change in the test variables (see Table 4-1). Separate containers were used to obtain pre-H₂O₂ influent, post-H₂O₂ influent and UV effluent samples for UVT and H₂O₂ on site analysis, with the analysis being completed by Trojan within approximately 15 minutes of sample collection. Samples were placed in coolers with ice and collected by the Weck sample couriers, with Chain of Custody procedures followed.

UV Transmittance (UVT)

Samples for the “background” water UVT analysis (prior to H₂O₂ injection but after UVT modification) were collected from the online UVT meter (i.e., Trojan Optiview) sample line that is drawn from the common influent header immediately upstream of the H₂O₂ injection port. The hydraulic retention time (HRT) between this port and the Aqua Hume injection port is approximately 1 minute at a flow of 2,000 gpm. Grab samples for the background water and from

the UV influent and effluent sample ports were measured using a 4-cm path length quartz cell and a RealUVT™ 254 nm portable photometer (RealTech Inc., Canada).

Hydrogen Peroxide

Hydrogen peroxide was measured using the DPD/peroxidase method described by Bader *et al.* (1988). In this procedure, hydrogen peroxide reacts with DPD reagent (Hach Company) through a reaction catalysed by the peroxidase enzyme (horseradish peroxidase, Millipore Sigma USA).

Hydroxyl Radical Scavenging Demand

As mentioned in section 3.2.2, Trojan routinely determines the scavenging demand of water samples at its laboratory in London, Ontario. The scavenging determination SOP involves spiking into an aliquot of the water sample a probe compound, for which the rate constant for the •OH reaction is available in the published literature and which was also confirmed by Trojan, and H₂O₂. The spiked water samples are irradiated to precise UV doses at 253.7 nm from a UV lamp mounted in a low-pressure collimated beam apparatus. The *quasi*-parallel UV light beam is perpendicular to the water sample surface. UV fluence rate at the water surface is measured using a calibrated radiometer (International Light Technologies Inc.) and the exposure times with NIST traceable stopwatches. The sample results are used to develop a UV dose-response relationship, from which the probe degradation kinetics is calculated, and subsequently the •OH water matrix scavenging capacity is determined.

1,4-Dioxane and Remaining Parameters

All analyses were performed by Weck Laboratories, Inc. (Industry, CA). Chain-of-custody forms were used, and the laboratory reports were sent to Walsh and Brown and Caldwell. TCE and PCE were analyzed using USEPA method 524.2, with MRLs of 0.50 µg/L and MDLs of 0.18 µg/L. 1,4-Dioxane analysis was performed using USEPA method 522 with an MRL of 0.070 µg/L and a method detection limit (MDL) of 0.028 µg/L. All parameter method details are listed in Table 4-2.

Table 4-2: Analytical details for Weck Laboratory methods.

ANALYTE	METHOD	MDL	MRL	UNITS
1,4-Dioxane	EPA 522	0.028	0.07	µg/L
TCE	EPA 524.4	0.18	0.5	µg/L
PCE	EPA 524.4	0.18	0.5	µg/L

Note that Lamp Power, H₂O₂ Setpoint and Lamp Sections On values for Auto control mode runs (i.e., 4 to 20) are estimates based on specified operating conditions and design water quality.

5 RESULTS

5.1 MIXING AND STEADY STATE

A mixing/steady state test was completed on September 21st, 2023. The test was performed at a flow of approximately 1,000 gpm through UV train 2 with the UV reactor off and using Aqua Hume as the tracer compound. At time $t=0$ minutes Aqua Hume injection was started and samples were collected from the UV influent and UV effluent sample ports at various times up to 32 minutes. The grab samples were measured for UVT using the bench-top Real Tech photometer.

UVT values were converted to UV absorbance ($UVA = -\text{Log}(UVT)$) and the test results are plotted versus time in Figure 5-1. UVT was reduced by Aqua Hume from 97.5% to about 85.7%. The data in Figure 5-1 shows that UVA had reached steady state at the UV influent port about 3 or 4 minutes after beginning Aqua Hume injection and it took at least 6 minutes more before steady state UVA was reached at the UV effluent sample port. There was an anomalous UV influent UVA result for the sample collected at 10 minutes, where the UVA decreased significantly to 0.0567 cm^{-1} before increasing again in the next sample at 15 minutes to 0.0671 cm^{-1} . Because of this anomalous sample, it was decided to conclude that steady state with respect to UVA/UVT at the UV effluent sample port is achieved 20 minutes after beginning Aqua Hume injection. Given that the 1,4-dioxane stock solution is injected at approximately the same location as the Aqua Hume injection port, the 1,4-dioxane would also reach steady state at the UV effluent port 20 minutes after beginning injection. Therefore, for a system flow of approximately 1,000 gpm the UV effluent samples were collected a minimum of 20 minutes after beginning Aqua Hume and 1,4-dioxane injection. Assuming that time to reach steady state is inversely proportional to flow, for flows of 1,500 gpm and 2,000 gpm, samples were collected 15 minutes and 10 minutes, respectively, after beginning injection at those flowrates. Given that the calculated HRT in the UV reactor at the design flow of 2,000 gpm is approximately 3 minutes, UV influent samples were collected up to 3 minutes prior to collecting the UV effluent samples.

Figure 5-1 Mixing/steady state test results performed at 1,000 gpm through UV Train #2.

5.2 WATER QUALITY

Water samples were collected from the site on each of the five test days of Performance Testing (September 22 and October 2-5) and sent to the Trojan Laboratory for analysis of water quality parameters. The sampling location varied and included the pre- and post-greensand filtration ports and pre- and post- 1,4-dioxane and UVT modifier spiking (in post-greensand filtration samples) ports. One sample was collected at the UV effluent port for the purpose of examining the change in the water quality parameters relative to those of the UV influent sample. Therefore, one should differentiate between the water quality parameters representative to the well water and/or well water blend and those which are representative to the actual test conditions (i.e., in the presence of 1,4-dioxane with or without Aqua Hume addition). The only sample containing H₂O₂ was the sample collected at the UV effluent port. The samples collected during the Performance Testing and their description along with the water quality parameters reported by the Trojan Laboratory are summarized in Table 5-1.

As shown in Table 5-1, the well blend samples were collected once per day. If the water quality parameters did not change during the day of testing, then the analytical data shown in Table 5-1 would be valid for all tests performed on that day. However, should the water quality vary during the day, the data reported in the table should be considered with caution as it may represent only the water parameters associated with the tests performed at the time of sampling.

Table 5-1: Trojan water quality results for Arcadia WTP samples.

Sample SM8 post-greensand filtration was collected and analyzed in September 2023 when tests PT12 and PT13 were performed. The data shown in Table 5-1 for the 50:50 SM8:SM9 well water blend used in all October tests except PT10 and PT11 (100% SM9 well water) may not reflect the average of the parameters listed for the SM8 (Sep 2023) and SM9 (Oct 2023) samples, as the water quality of SM8 well water may have varied from September to October.

The next paragraphs are concerned with a brief data interpretation of the Trojan analytical results for the samples shown in Table 5-1.

UV Transmittance (UVT). The UVT in samples collected under ambient water quality conditions varied from 98.3% to 99.1% (October samples), with the UVT of 96.7% measured for SM8 sample collected and analyzed in September. Sample UV-PT2 UV Influent pre-H₂O₂ contained Aqua Hume, which was intentionally added to the well water blend for testing the UV/H₂O₂ system performance at the design UVT. The UVT data reported by Trojan Laboratory agree well with the UVT data recorded at the site for the tests performed in those days.

Water pH. The pH data for the October samples collected from test runs at the ambient water pH condition spanned from ~7.2 (PT9 pre-H₂O₂) to ~7.7 (Pre-greensand and PT2 post-greensand pre-spike); pH of SM8 sample collected during Performance Testing event in September was also within this range. All these values are larger than those recorded at the site (~6.8 – 7.1). The pH values in samples from PT20 test (pre-H₂O₂ and UV Effluent) were ~7.0 and 6.9, respectively, also greater than those measured at the site, i.e., 6.5. Of note, for this PT20 test, pH was intentionally depressed at the site to examine the impact of pH on 1,4-dioxane, PCE and TCE degradation yields relative to those observed in tests at ambient pH. The water in the two wells (SM8 and SM9) are high in alkalinity. Since carbonic acid pK_{a1} is 6.35, lowering pH would reduce the concentration of bicarbonate ion in the favor of carbonic acid, thus, reducing the OH radical ST capacity of the water; $k(\bullet\text{OH}, \text{HCO}_3^-) = 8.5\text{E}+06 \text{ M}^{-1} \text{ s}^{-1}$; $k(\bullet\text{OH}, \text{CO}_2) = <1\text{E}+06 \text{ M}^{-1} \text{ s}^{-1}$; Buxton *et al.*, 1988). The overall alkalinity (as CaCO₃) in a given water sample would be *quasi*-similar at pH ~7 and ~6.5, while the contribution of bicarbonate to the overall OH radical water matrix demand would be different due to the pH-driven distribution of the two carbonate species (H₂CO₃ and HCO₃⁻). Therefore, in a given water, a lower ST is expected at pH 6.5 than at pH~7, and that is reflected in Table 5-1 which shows the lowest ST in PT20 pre-H₂O₂ sample of pH 6.5 as measured at site.

Total Organic Carbon (TOC). The TOC concentration was very low in all samples and varied from ~0.5 to ~1.0 mg/L. These low TOC levels explain the high UVT values measured for the samples at ambient water quality condition and, although the TOC speciation (i.e., composition) is not known, it would indicate a relatively small contribution of the organics constituting TOC to the overall OH radical water matrix demand.

Of note, the difference of ~0.2 mg/L in the TOC measured in samples PT2 post-greensand pre-spike and UV-PT2 pre-H₂O₂ is attributed to the organic matter contained in the Aqua Hume amount added to the water as a UVT modifier, and it is associated with the observed change in UVT.

Alkalinity (expressed as CaCO₃). Alkalinity was high in all samples and ranged from 377 to 387 mg/L in greensand-filtered 50:50 SM8:SM9 well blend samples at their ambient pH. The PT20 samples (UV influent and UV effluent) had similar alkalinity (~305 mg/L) and lower than observed in the other samples (50:50 well blend), due to the lower pH in these samples. The alkalinity concentration measured in the SM8 (September) and SM9 (October) water samples was 335 and 432 mg/L, and bracketed the values determined in the blended water. At a 50:50 SM8:SM9 blending ratio, the calculated alkalinity would be ~384 mg/L, which is also within the measured range, and may indicate that the alkalinity in wells SM8 and SM9 was constant throughout the Performance Testing event.

Nitrate. Except for the SM8-only and SM9-only samples, all the other samples represent a 50:50 well water blend. Nitrate ranged from 22.5 to 25.0 mg/L as NO₃⁻. Nitrate in the SM8 (September) and SM9 (October) samples were quantified as 29.0 and 19.0 mg/L as NO₃⁻, which bracketed the data for the blended water, but also indicated a significant difference in water quality of the two wells. Nitrate is a rather poor absorber of the 253.7 nm radiation (molar absorption coefficient of ~4 M⁻¹ cm⁻¹), but in high concentrations and at high UV doses, its photolysis to *intermediates* leading to nitrite becomes significant. Therefore, *in-situ* formation of nitrite and its reaction with hydroxyl radical is not negligible. Moreover, pH, alkalinity and H₂O₂ concentrations play important roles in nitrate photolysis to nitrite, with nitrite increasing as these parameters' values increase. The mechanism is complex and not fully elucidated in the literature studies.

Nitrite. The nitrite levels measured by Trojan in all samples except for the PT20 UV Effluent sample were very low and approached the 10 micrograms/L detection limit of the ion-chromatography method used by Trojan. The nitrite measured in the PT20 UV Effluent was ~103 micrograms/L. During UV-AOP treatment nitrite is simultaneously formed through direct UV photolysis of nitrate and destroyed through rapid reaction with the OH radical. This rapid reaction with the OH radical means that nitrite has the potential to be a significant OH radical scavenger. The UV-AOP controls program accounts for this formation of nitrite and its impact on the ST. However, if significant nitrite ion was present in the UV influent water and if its concentration in the influent water was variable during the Performance Testing, then it could cause unrecognized variability in the ST from test to test. It is also important to mention that nitrite is slowly oxidized to nitrate by dissolved oxygen and this reaction could have occurred between the time of sample collection and nitrite analysis. Therefore, it is conceivable to assume that the levels reported by Trojan in Table 5-1 could be lower than those in the samples at their collection time.

A sample identified as PT-SW8-S4 was collected by Brown and Caldwell at the greensand influent port on the morning of Oct 4th (PT8 test condition) and submitted to Weck Laboratories for comprehensive analysis. According to Weck's report, the sample contained 50 micrograms/L nitrite-N, which is equivalent to 164 micrograms/L NO₂⁻. It is unclear whether the greensand filter would remove nitrite, and whether the water quality parameters of the well water blend varied during the day of Oct 4th. Nitrite is a strong OH radical scavenger and its contribution to the ST at a 164 microgram/L level would be approximately 36,000 s⁻¹, estimated using $k(\bullet\text{OH}, \text{NO}_2^-) = 1.0\text{E}+10 \text{ M}^{-1} \text{ s}^{-1}$ (Buxton et al. 1988).

It should be noted that typical operation of the greensand filters will involve injection of sodium hypochlorite upstream of the filters and this would oxidize any nitrite ion, converting it to nitrate. However, hypochlorite was not injected during any of these performance tests and therefore nitrite ion present in the well water could have increased the ST during these performance tests.

OH Radical water matrix “demand” (also commonly known as OH radical term, ST). The OH radical ST (s^{-1}) was determined only for some of the samples received by Trojan. Note that the OH radical ST for SM8 Post-greensand sample was determined in September and it would be characteristic to the water used in those tests (PT12 and PT13). 1,4-Dioxane in that water sample would have been at its ambient level. The same statement is valid for the Pre- H_2O_2 (Oct 3 15:45) and SM9 PT10 Pre- H_2O_2 , i.e., the listed OH radical STs are representative to the 50:50 well water blend and 100% SM9 well water, respectively. However, should the well blend quality vary from one day to another or during the day of testing, the analytical data shown in Table 5-1 would be representative only to the test(s) conducted at the time of sample collection. All OH radical STs shown in Table 5-1 include the contributions of alkalinity, organic and inorganic compounds present or added to the water (except for H_2O_2) and of nitrite present and/or formed from the intermediates of nitrate photolysis.

The OH radical STs determined in the samples listed in Table 5-1 are dominated by the contribution of alkalinity, e.g., 74.5% (SM-8 Post-greensand); 56.5% (UV-PT2 UV Influent pre- H_2O_2); 66% (Oct 3rd Pre- H_2O_2); 62% (PT20 pre- H_2O_2); 90% (SM9 PT10 pre- H_2O_2). The largest value of 128,000 s^{-1} was observed for the UV-PT2 UV Influent pre- H_2O_2 sample, which contained both 1,4-dioxane and Aqua Hume spiked during that test. Therefore, along with the contributions of alkalinity, of nitrite formed from nitrate photolysis and subsequent reactions of its intermediates, and of 1,4-dioxane, there is some contribution from Aqua Hume to the ST of the October 3rd UV Influent pre- H_2O_2 sample.

As expected, the lowest OH radical ST across all samples collected from the October tests (85,300 s^{-1}) was determined in the PT20 Pre- H_2O_2 (Oct 4 15:00) sample. That is essentially explained by a lower contribution of alkalinity to the overall ST than in the other samples due to the lower pH (6.5) of the water in this test. Note that 1,4-dioxane was also present in this sample received from the site and nitrite was also formed during the procedure of ST determination.

The lower ST at a low pH is primarily explained by the reaction of peroxyxynitrite ($ONOO^-$), which is the key intermediate in nitrate photolysis, with CO_2 (higher concentration at low pH than at neutral pH) leading to nitrate and to the decomposition of peroxyxynitrous acid ($ONOOH$), which is the conjugate acid of peroxyxynitrite, to nitrate (70%), both of which reduce the nitrite yield [$pK_a(ONOOH)=6.8$; $pK_a(H_2CO_3)=6.35$].

5.3 ON-SITE DATA AND MEASUREMENTS

Table 5-2 presents several key on-site measurements recorded for each test run. These include the measured flow and the estimated percent well blend, the number of lamp sections operating, and the percent lamp power level, the control mode (i.e., manual or automatic), the ST value entered into the PLC, the online influent (i.e., pre-H₂O₂) UVT value, the PLC-calculated influent H₂O₂ concentration and predicted effluent H₂O₂ concentration. The compliance and operating log reduction targets for 1,4-dioxane, TCE, and PCE are also listed, along with the PLC-calculated (i.e., predicted) log reductions for each contaminant in all tests. The default PLC program does not provide performance predictions when the system is in local control mode and the entered target log reduction values are irrelevant. A subsequent update of the PLC program enabled these performance predictions to be provided when the system was operated in local control mode.

Table 5-3 lists the results of on-site benchtop analyses, including measured UVTs and H₂O₂ concentrations, for UV influent and UV effluent samples for each test. Also presented in Table 5-3 are the UV influent ‘background’ UVTs provided by the Trojan Optiview online UVT meter and the ‘background’ UVTs of grab samples collected upstream of H₂O₂ injection and downstream of Aqua Hume injection and measured on-site using the benchtop photometer. The presented background influent UVT and background effluent UVT values are calculated from the measured influent and effluent UVTs by subtracting the contribution to those UVTs by the measured H₂O₂ concentrations. The background water includes the impact of Aqua Hume on UVT. The online pH meter values are also provided for each test.

UVT Measurements and PLC calculations

Figure 5-2 compares the online UVT measurements to the background UVT grab samples measured using the bench-top photometer. The results are in very good agreement, suggesting that the online UVT meter will provide a highly accurate UVT signal upon which the PLC can base contaminant log reduction predictions. Furthermore, as presented in Table 5-3, the calculated influent background UVT based on the analyses of influent UVT and H₂O₂ also agree very well with both the online and grab sample measurements. The agreement among the three UV influent background UVT sets also validates the calculation method, which is the same calculation method used by the PLC to determine the UVT of the influent water. The same calculation method is also used to predict the background UVT of the water leaving the UV reactor (i.e., UVT of water in absence of H₂O₂). For the control test for which the UV reactor was off, we see that the calculated effluent background UVT is almost identical to the influent background UVT, as expected. Nevertheless, for all other tests the effluent background UVT has increased relative to the influent UVT and especially so for those tests in which Aqua Hume was injected. While this change is difficult to predict, it is not unexpected and is thought to be due to partial AOP treatment of the UV absorbing molecules in the Aqua Hume (e.g., humic & fulvic acids) resulting in decreased UV absorbance, as discussed in Section 5.2. The data for these tests show that the absolute change in UVT is inversely proportional to the UVT of the influent water. That is, Test 5 resulted in ~2.5% increase in UVT across the reactor while tests 1 to 4 averaged about a 1.94% increase and the remaining tests averaged about a 0.74% increase. That is, the higher the concentration of Aqua Hume that was dosed, the larger the increase in UVT. It is also observed that the increase in background UVT was less (i.e., 0.46%

average) for the tests targeting the lowest treatment levels (i.e., tests 7, 8, 14 & 15) and conducted at ambient UVT. That is, when less AOP treatment was applied, there was less apparent degradation of the UV-absorbing compounds.

Figure 5-2: Comparison between online UVT and measured background UVT.

The experimental data presented in Table 5-3 were also used to demonstrate how accurately the UV system control algorithm predicts the UV influent and UV effluent UVTs. The control algorithm calculates the UV influent UVT from the online UVT value and the H₂O₂ concentration. To exemplify, the control algorithm equation was used with the online pre-H₂O₂ UVTs with the PLC-requested H₂O₂ concentrations to calculate the UV influent UVT. A similar approach was used to calculate the UV effluent UVTs, that is, taking the online UVT adjusted for the PLC-calculated residual H₂O₂ concentration. These calculated UVT values are included in Table 5-3. The calculations assume that no or negligible changes would occur in the water background UVT during the UV/AOP treatment. Figure 5-3 (A) shows the comparison between measured UV influent UVTs and PLC-calculated UV influent UVTs. The agreement is very good for the UV influent data, thereby providing confidence in the calculation method used by the system controls to predict the influent UVT. Figure 5-3 (B) shows the comparison between measured UV effluent UVTs and PLC-calculated UV effluent UVTs. While the calculated effluent UVT trends well with the measured values, all measured effluent UVT values are higher than the predicted values and the discrepancy is greater for the lower UVT test conditions. This discrepancy corresponds to the observed increase in the background UVT across the reactor discussed above. The UVT modifier (Aqua Hume) is not a naturally occurring

constituent of the well water; thus, the UVT changes observed in the Aqua Hume-spiked tests are not representative to treatment conditions of typical well water.

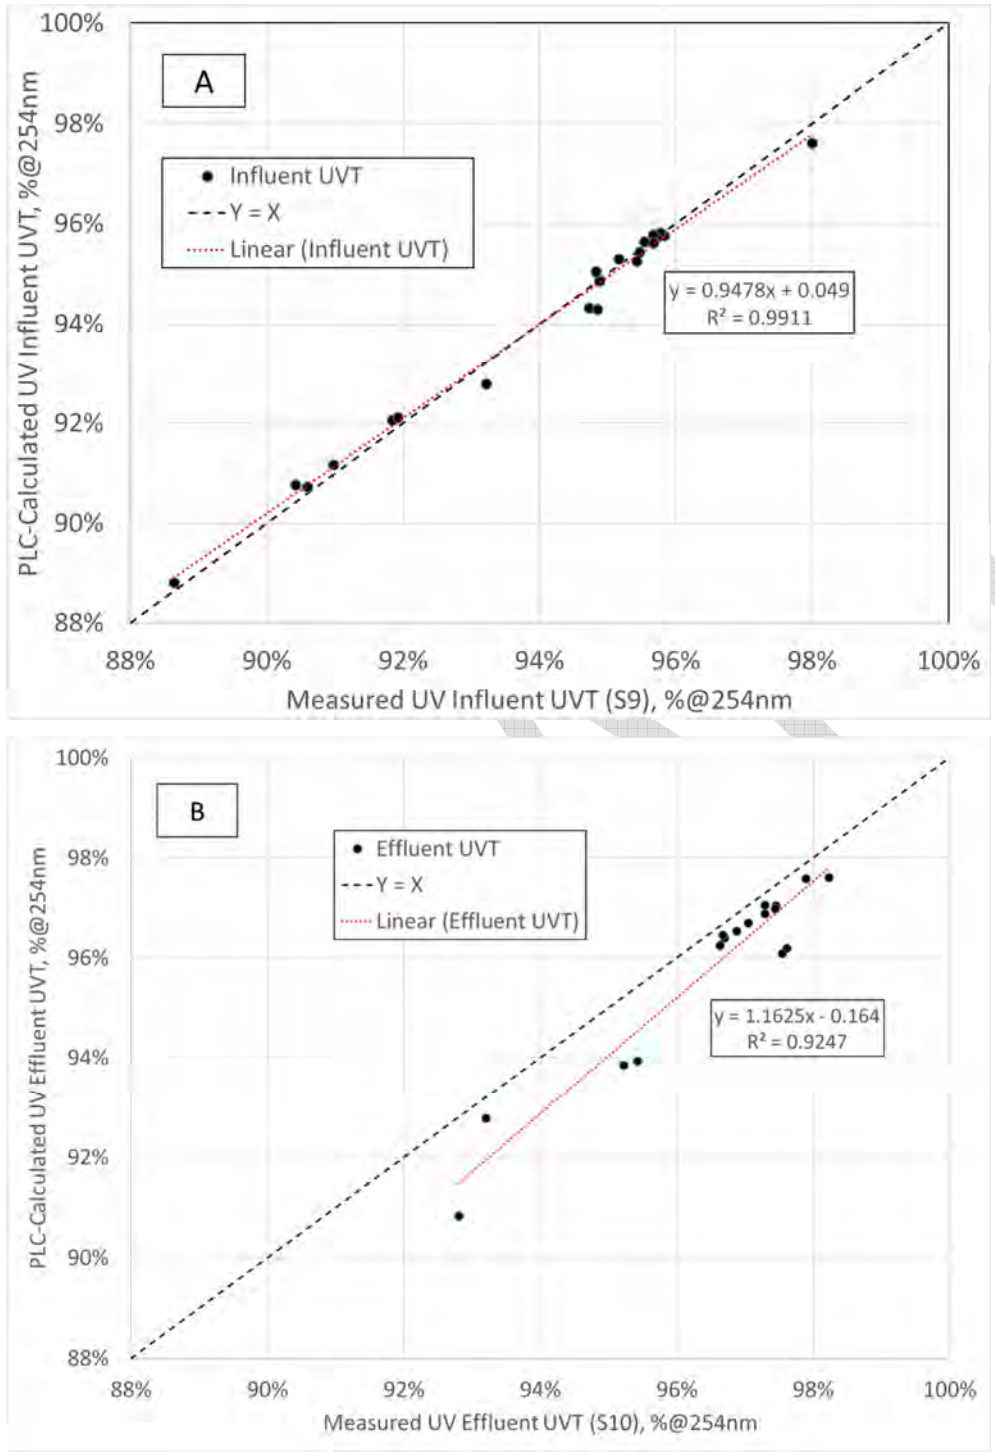

Figure 5-3: Comparison between measured and PLC-Calculated UVT

Hydrogen peroxide Measurements and PLC calculations

The PLC-requested UV influent H₂O₂ concentrations and PLC-predicted residual (i.e., UV effluent) H₂O₂ concentrations are plotted against the measured values in Figure 5-4. The measured H₂O₂ values plotted in Figure 5-4 are the results of the influent and effluent grab sample measurements. The PLC-calculated influent H₂O₂ concentrations for tests 10 and 16 were inadvertently not recorded. Also, the PLC-predicted H₂O₂ residuals were not available for the manual tests 1 to 3, 10, and 16. Figure 5-4 demonstrates very good agreement between the predicted and measured data. The excellent agreement between the predicted and measured influent H₂O₂ concentrations provides confidence in the reliance on the predicted concentrations in the absence of a reliable online analytical instrument. The PLC calculates the UV effluent H₂O₂ concentration based on the UV influent concentration and the predicted H₂O₂ destruction through the reactor. The UV influent and effluent H₂O₂ concentrations are then used to determine the average H₂O₂ concentration through the UV chamber, and subsequently the contaminant log reductions. Figure 5-4 shows that while the measured and PLC-predicted UV effluent H₂O₂ concentrations trend very well, the measured UV effluent H₂O₂ concentrations are consistently slightly higher than the predicted effluent concentrations. The impact of that underpredicted effluent H₂O₂ concentration is to add some conservatism to the predicted contaminant treatment.

Figure 5-4: Comparison between measured and PLC H₂O₂ concentrations.

5.4 TARGET CONTAMINANT TREATMENT

Table 5-5 lists the 1,4-dioxane data reported by Weck Laboratories, while the TCE and PCE analytical data are reported in Tables 5-6 and 5-7, respectively. As well as the analytical data

reported by Weck for the duplicate influent and effluent samples, these tables also list the relative standard deviation (RSD) of the duplicate analyses and the average contaminant log reduction for each test. The average log reduction is calculated by taking the log of the average influent concentration divided by the average effluent concentration (i.e., $\text{Log}(\text{avg inf}/\text{avg eff})$). The PLC-entered compliance and operating LR setpoints as well as the PLC-predicted LRs for each test are also included.

All UV influent and effluent 1,4-dioxane concentrations were >MDL for all tests and therefore a quantifiable LR value can be reported for each test. Table 5-5 shows that the influent 1,4-dioxane concentrations ranged from 19 $\mu\text{g}/\text{L}$ to 470 $\mu\text{g}/\text{L}$, while the effluent concentrations ranged from 0.043 $\mu\text{g}/\text{L}$ to 2.5 $\mu\text{g}/\text{L}$, except for the control tests. Recall that 1,4-dioxane was spiked into the UV influent stream at concentrations sufficient to produce UV effluent concentrations that were greater than the MRL. The RSD of the influent duplicates ranged from 0% to 19% for the non-control tests and were all considered acceptable. However, the RSD for the effluent duplicates ranged from 0% to 108% with the effluent results for tests 6 and 16 having RSD values >100%. Looking closer at those test results, it is recommended to consider the Test 6 effluent result of 2.2 $\mu\text{g}/\text{L}$ as an anomaly and to use the other replicate value of 0.37 $\mu\text{g}/\text{L}$ as the true value. Recalculating the 1,4-dioxane LR for Test 6 results in the value increasing from the average LR of 2.46 to 3.0 using the 0.37 $\mu\text{g}/\text{L}$ effluent result. Similarly, for Test 16 it is recommended to consider the effluent result of 2.4 $\mu\text{g}/\text{L}$ as an anomaly and to instead rely on the 0.32 $\mu\text{g}/\text{L}$ result as the true value. That results in the 1,4-dioxane LR value for Test 16 increasing from 2.46 to 3.08. Other than those two tests with effluent RSD values >100%, the average UV effluent RSD of the 1,4-dioxane analyses for all other tests was 14% and this is considered to be acceptable. The results of the two control tests for which the 1,4-dioxane LRs were reported as 0.00 and 0.03 confirm that treatment is not provided in the absence of both UV energy and H_2O_2 together. We can also conclude from these control test results that the sampling and analytical methods do not contribute to anomalous results.

The analytical test results for PCE and TCE provided in Tables 5-6 and 5-7 respectively are quite different than those for 1,4-dioxane, where quantifiable 1,4-dioxane amounts were in the UV effluent samples. That is because these contaminants were not spiked into the influent stream. The average measured UV influent PCE concentration for the tests treating a 50% blend of wells SM-8 and SM-9 was 13.6 $\mu\text{g}/\text{L}$, whereas the result for SM-8 only was 2.0 $\mu\text{g}/\text{L}$ and that for well SM-9 only was 27 $\mu\text{g}/\text{L}$. All UV effluent PCE concentration results were less than the MDL of 0.18 $\mu\text{g}/\text{L}$ except for tests C1, 7, 8, 14 and 15, which targeted low treatment levels. The LRs reported in tables 5-5, 5-6 and 5-7 are calculated for each individual test as the $\text{Log}([\text{inf}]/[\text{eff}])$ where the [inf] term is the average UV influent concentration of the replicate samples and the [eff] term is the average UV effluent concentration of the replicate samples. To calculate the contaminant LR in tests where PCE and TCE in the effluent sample were reported as below the MDL, the MDL value (e.g., 0.18 $\mu\text{g}/\text{L}$ for PCE & TCE) was used in the calculation of the average effluent concentration. Since the true concentration value could be less than the MDL, the resulting LR calculations are considered to be conservative.

It is noteworthy that while control test C1 with approximately 40 mg/L H_2O_2 but no UV resulted in no treatment of PCE, control test C2 with all lamps at 100% BPL but no H_2O_2 produced >1.9 LR based on an effluent concentration of <0.18 $\mu\text{g}/\text{L}$. That demonstrates that the contributions to PCE LR from direct UV photolysis are significant.

The average measured UV influent TCE concentration for the tests treating a 50% blend of wells SM-8 and SM-9 was 32 $\mu\text{g/L}$, whereas the result for SM-8 only was 80 $\mu\text{g/L}$ and that for well SM-9 only was 1.8 $\mu\text{g/L}$. All UV effluent TCE concentration results were less than the MDL of 0.18 $\mu\text{g/L}$ except for tests C1, C2, 7, 8, 14 and 15, which targeted low treatment levels. It is noteworthy that while control test C1 with approximately 40 mg/L H_2O_2 but no UV resulted in no treatment of TCE, control test C2 with all lamps at 100% BPL but no H_2O_2 produced 0.4 LR. That demonstrates the expected result that direct UV photolysis of TCE is much less significant than that of PCE, but needs to be considered. This observation is also consistent with the photolysis quantum yields reported in the literature for PCE and TCE.

1,4-Dioxane Spiking

Given the significant range of expected treatment levels, the spiked concentration of 1,4-dioxane was varied from test to test to target an effluent concentration of around 0.1 µg/L. The measured concentrations of 1,4-dioxane in the UV influent samples should represent the sum of the spiked concentrations and the ambient 1,4-dioxane concentrations in the groundwater. Figure 5-5 compares the calculated spiked concentration to the measured UV influent concentration for each test to demonstrate the correlation. Note that tests C1, C2, 7, 8, 14 and 15 targeted spike levels between 1 µg/L and 6.4 µg/L, given their relatively low target LRs. Those low spike levels were achieved using a 1,4-dioxane stock concentration of 6.2 g/L, whereas all remaining tests used a 1,4-dioxane stock concentration of 146 g/L. Given that the four UV influent samples for the control tests (i.e., C1 & C2) averaged 23 µg/L 1,4-dioxane and only 1 µg/L was spiked. From this it is estimated that the ~50:50 blend of SM-8 and SM-9 well water contained approximately 22 µg/L 1,4-dioxane. Therefore, the ideal result for Figure 5-5 would see all data points in a parallel line below the line of Y = X and offset to the right by 22 µg/L. While there are variable results, Figure 5-5 shows the linear regression line of the data points to almost exactly matched that ideal result. That is, the slope of the regression line is >0.99 with an X-intercept of -23 µg/L. It is suggested that the observed variability is likely due primarily to analytical variability.

Figure 5-5: Measured UV Influent Contaminant Concentrations versus Calculated Concentrations

Comparison of Measured and Target Contaminant Log Reductions

The 1,4-dioxane compliance and operating LR setpoints, PLC-predicted LRs, and measured LRs that are provided in Table 5-5 are plotted in Figure 5-6. The measured LRs are represented by the blue bars and the arrows above those for tests 6 and 16 are to indicate that the true measured LRs should likely be 3.0 and 3.08, respectively, as discussed above. The associated compliance and operating LR setpoints as well as the PLC-predicted LR values are represented by the red, green, and purple bars. The compliance LR setpoints were selected according to the test matrix presented in Table 4-1, whereas the operating setpoints were set to be 10% higher than the compliance level. The UV system PLC will operate the system to target the operating LR setpoints for the three controlling contaminants (e.g., 1,4-dioxane, PCE & TCE). Thus, the operating setpoint represents an adjustable operational conservatism relative to the compliance setpoint. The PLC-predicted LRs are calculated by the PLC based on the live online inputs of flow, UVT, H₂O₂ dose, UVI data and number of operating lamp sections, plus the manually entered hydroxyl radical ST and nitrate level as well as the kinetic parameters for each contaminant. As previously described, predicted LRs are not available for all manual mode runs. Furthermore, LR setpoints are irrelevant for manual mode runs since the PLC is not controlling to them. Most tests had a 1,4-dioxane compliance LR setpoint at the design value of 2.4 with the operating target at 2.64. The PLC-predicted LRs are just slightly above the operating target for all those tests, as expected.

Figure 5-6: 1,4-Dioxane Log Reduction Values: Comparison of Measured, Target and Predicted Values.

Table 5-5 and Figures 5-6 demonstrate that the measured 1,4-dioxane LR values exceeded the target and predicted values for all tests except runs 7, 8, 14 and 15. For those four tests, which had a reduced 1,4-dioxane LR target of 1.2, 3 of the 4 runs met or exceeded the compliance target, while test 14 achieved 92% of the compliance target LR (i.e., 1.1 vs 1.2). Tests 14 and 15 are duplicate tests with the same operating conditions and treatment targets. Nevertheless, run 15 measured 1.22 LR 1,4-dioxane while run 14 measured 1.1 LR. This relatively minor discrepancy is likely due to analytical uncertainty as the range of LRs calculated from both sets of analytical data (i.e., both tests 14 & 15) is from 1.0 to 1.4. As listed in Table 5-2, tests 14 and 15 were performed with the pH reduced to 6.5, which was expected to have an associated reduced ST. As such, the ST entered into the PLC for those tests was 90,000 s⁻¹ whereas the measured ST value was slightly lower as presented in Table 5-1. To reiterate, the “measured” ST value corresponds to PT20 pre-H₂O₂ sample associated with test PT20 which was run on the same day as tests PT14 and PT15, but earlier in the day.

Another means of viewing the comparison between target and measured LR values is the X-Y plot presented in Figure 5-7. In this figure the measured 1,4-dioxane LR values are compared to both the compliance LR setpoint and the operating LR setpoint. Data points below the line of unity (i.e., Y = X) represent test conditions where the measured LR exceeded the setpoint target. Figure 5-7 presents a clearer view of the overall performance that was described in run-by-run detail in Figure 5-6. That is, Figure 5-7 shows that 13 of the 17 runs performed in ‘auto’ control mode exceeded both the compliance and operating LR targets. Furthermore, of the 4

data demonstrated it to be greater than 1.9, with an effluent PCE concentration less than the MDL.

As shown in Table 5-6 and Figure 5-8 it cannot be definitively concluded that the measured PCE LR values exceeded the target and predicted values because most tests produced effluent PCE concentrations below the MDL of 0.18 $\mu\text{g/L}$. During the planning phase of this work, Trojan prepared a document titled “*Rationale for Proposing 1,4-Dioxane Removal Yield as an Indicator for Tetrachloroethene (PCE) and Trichloroethene (TCE) Removal Efficiency from Groundwater with the UV/H₂O₂ AOP at Water Treatment Facilities*”. This document explains how the known photochemical kinetic parameters for 1,4-dioxane, PCE and TCE can be applied together with the water quality parameters to calculate their fluence-based rate constants and that the LR ratios of the contaminants are proportional to these rate constants. For example, in that document, it was concluded that the LR ratio would be 1.00:1.00:1.22 for 1,4-dioxane:PCE:TCE when treating the design water quality (i.e., $ST=130,000\text{ s}^{-1}$; NO_3^- 35 mg/L) at the reactor average H_2O_2 dose of 31 mg/L. The Trojan PLC program and Trojan’s offline kinetic model have the photochemical kinetic parameters and fluence-based rate constant equation incorporated as part of the calculations. One discrepancy between these models and the referenced document is that they use the lowest reported value for the rate constant for the reaction of OH radicals with PCE (i.e., $2.0\text{E}+09\text{ M}^{-1}\text{s}^{-1}$) as opposed to the average value (i.e., $2.33\pm 0.41\text{E}+09\text{ M}^{-1}\text{s}^{-1}$) and so the models are more conservative with respect to PCE treatment when compared with the predictions in the document. Similarly, the kinetic models also use a more conservative OH radical rate constant for TCE (i.e., $2.9\text{E}+09\text{ M}^{-1}\text{s}^{-1}$) than the average value (i.e., $3.39\pm 0.70\text{E}+09\text{ M}^{-1}\text{s}^{-1}$) used in the document. Both of these models can be used to generate the expected ratio of PCE LR to 1,4-dioxane LR for each test condition. Using the offline kinetic model together with the measured water quality, this ratio ranged from 0.91 to 1.02 and was used to generate predicted PCE LRs based on the measured 1,4-dioxane LRs and these predicted PCE LRs are presented as the light blue bars in Figure 5-8. Recent literature studies showed that the superoxide radical anion ($\text{O}_2^{\bullet-}$) contributes to PCE and TCE degradation in H_2O_2 -catalyzed processes (Watts and Teel, 2019). In high alkalinity waters this radical reaches relatively high steady-state concentrations because it is formed from both OH and carbonate radical reactions with H_2O_2 . There are other routes to the formation of this radical, but of a minor importance. The reactions of with PCE and TCE are not included in Trojan’s kinetic model, as, to the best of our knowledge, no rate constants are available in the public domain.

The predicted PCE LR exceeds the operating setpoint for all tests for which the effluent PCE concentration was below the MDL. The measured effluent PCE concentration for run 10 was above the MDL and below the MRL and resulted in a measured LR of 2.03 whereas the compliance target was 2.3. It should be noted that analytical data that is below the MRL has a greater uncertainty associated with its quantification. Tests 10 and 11 were performed with well SM-9 only at a flow of 1,000 gpm. Run 10, which had a higher ST entered into the PLC, was performed with slightly higher UV power and higher H_2O_2 and so it should have provided more treatment than run 11, which produced an effluent PCE concentration below the MDL. The test 10 result also disagrees with the predicted PCE LR based on the measured 1,4-dioxane LR value. For all these reasons, the test 10 PCE result is considered to be an anomaly. Furthermore, similar to the 1,4-dioxane results, runs 7, 8, 14 and 15 did produce effluent PCE concentrations greater than the MDL and the resulting LRs were less than the predicted LRs. For those four tests which had a reduced PCE LR target of 1.15, 2 of the 4 runs met or exceeded the compliance

target while tests 14 and 15 achieved 92% of the compliance target LR (i.e., 1.06 vs 1.15). The predicted PCE LR based on the measured 1,4-dioxane LR are also lower than the operating target for all 4 runs and lower than the compliance target for run 14. The strong correlation between the measured and predicted LR for these runs provides confidence in those PCE LR predictions based on the measured 1,4-dioxane LR.

Figure 5-8: PCE Log Reduction Values: Comparison of Measured, Target and Predicted Values.

The TCE compliance and operating LR setpoints, PLC-predicted LR and measured LR values that are provided in Table 5-7 are plotted in Figure 5-8. The measured LR values are represented by the blue bars and the arrows above those bars are to indicate that the true measured LR values should likely be higher based on the measured effluent TCE concentrations being less than the MDL of 0.18 $\mu\text{g/L}$. The associated compliance and operating LR setpoints as well as the PLC-predicted LR values are represented by the red, green and purple bars. The compliance LR setpoints were selected according to the test matrix presented in Table 4-1 whereas the operating setpoints were set to be 10% higher than the compliance level. The PLC-predicted LR values are calculated by the PLC based on the live online inputs of flow, UVT, H_2O_2 dose, UVI data and number of operating lamp sections plus the manually entered hydroxyl radical ST and nitrate level. As previously described, the setpoint and predicted LR values are not available for all manual mode runs. Most tests had a TCE compliance LR setpoint at the design value of 2.2 with the

operating target at 2.44. The PLC-predicted LR for most runs are significantly above the operating target. 1,4-dioxane was the controlling contaminant for those runs and the associated predicted TCE LR value was higher than required. As shown in Table 5-7 and Figure 5-8 most tests produced effluent TCE concentrations below the MDL of 0.18 $\mu\text{g/L}$. Nevertheless, given the higher ambient concentration of TCE than PCE in the SM-8 well water, most tests were able to demonstrate that the compliance LR target was exceeded. That was also true for runs 7, 8, 14 and 15 which did produce effluent TCE concentrations greater than the MDL and the resulting LR values were significantly greater than the predicted LR values. As described for PCE above, the Trojan offline kinetic model was used to generate the expected ratio of TCE LR to 1,4-dioxane LR for each test condition. This ratio was pseudo-constant at 1.03 and was used to generate predicted TCE LR values based on the measured 1,4-dioxane LR values and these predicted TCE LR values are presented as the light blue bars in Figure 5-9. The predicted TCE LR exceeds the operating setpoint for all tests except tests 14 and 15 however, as noted above, the measured TCE LR values for tests 14 and 15 were greater than the operating setpoint and the PLC-predicted values. The overall conclusion regarding TCE treatment is that the compliance LR target is met or exceeded provided sufficient TCE is present to demonstrate the required LR. Only tests 10 and 11 were not able to definitively demonstrate that the compliance target was met because the influent TCE concentrations were too low.

Figure 5-9: TCE Log Reduction Values: Comparison of Measured, Target and Predicted Values.

The overall conclusion from the data presented above is that the measured 1,4-dioxane LR values exceeded the operating LR setpoints for all tests for which the 1,4-dioxane compliance LR target was either the design value of 2.4 or the reduced value of 1.8. For those runs with a 1,4-dioxane compliance target of 1.2 LR, 3 of the 4 runs demonstrated 1,4-dioxane LRs that met or exceeded the compliance LR setpoint. Although tests 14 and 15 are duplicate test runs, only test 14 provided a measured 1,4-dioxane LR value below the compliance setpoint of 1.2 LR. Similarly, although only 6 of the 22 test conditions, including the control tests, produced effluent PCE concentrations >MDL, based on the measured 1,4-dioxane LRs and the predicted ratio of PCE:1,4-dioxane LR, all tests except test 14 are predicted to exceed the compliance setpoints. Only 6 of 22 test conditions produced effluent TCE concentrations >MDL nevertheless, ambient TCE concentrations were high enough to demonstrate that the compliance setpoint was met or exceeded for all tests.

Test runs 14, 15 and 20 were all performed at a reduced pH of ~6.5 and a ST of 90,000 s⁻¹ entered into the PLC. The measured 1,4-dioxane and PCE LRs for tests 14 and 15 did not exceed the operating target and run 20 only exceeded that LR target by <5%. While water samples for ST determination were not taken during tests 14 or 15, the sample taken following test 20 measured 85,300 s⁻¹ as reported in Table 5-1. It is suggested that this measured ST value, while apparently very accurate for test 20, underestimated the ST of the water for tests 14 and 15. Trojan has calculated that a ST value of 112,500 s⁻¹ entered into the UV PLC would have resulted in the contaminant LRs exceeding the operating target (i.e., 1.32 LR for 1,4-D & 1.27 for PCE) for those two runs.

The measured 1,4-dioxane and PCE LRs for tests 7 and 8 were also lower than their respective operating target setpoints. Although those tests were operated using the 50:50 well blend, there was not a specific water sample evaluated for ST for the water treated during tests 7 and 8. Of note, tests 7 and 8 were the first tests performed on October 4th (8:50 and 9:10), whereas tests 14 and 15 were the last tests performed that day (15:25 and 16:00). A few source water samples were collected from the greensand influent during the October Performance Testing by Brown and Caldwell and sent for analysis to Weck Laboratories. The nitrite data reported by Weck for these samples and the corresponding calculated contribution of nitrite to the ST are shown in Table 5-8.

Table 5-8: Nitrite data for source water samples and its contribution to ST

Sample ID	Date and time of sampling	Nitrite (ug/L as N)	ST(NO ₂ -), s-1
PT-SWC2-S4	10/2/2023 13:00	51	36429
PT-SW4-S4	10/3/2023 9:53	ND	NA
PT-SW8-S4	10/4/2023 9:17	50	35714
PT-SW9-S4	10/5/2023 8:50	ND	NA

The information provided in Table 5-8 indicates the well blend quality varies from one day to another, and this observation is supported by other analytes quantified in these samples and not shown herein. The only source water collected on October 4th is PT-SW8-S4 and the sampling was done right after completion of tests 7 and 8. As stated earlier, there was no sample collected

for ST determination at the same time with either PT-SW8-S4 or tests 7 or 8. Furthermore, the $ST(NO_2^-)$ of $35,714\ s^{-1}$ corresponding to the nitrite level of $50\ \mu g/L$ as N quantified in PT-SW8-S4 sample, is far too high to be part of (i.e., included) in the ST of $85,300\ s^{-1}$ measured experimentally at Trojan for the test 20 sample (pH 6.5) collected on October 4th. Note that the ST measured for the test 20 sample covers the contributions of alkalinity ($52,800\ s^{-1}$), nitrite formed and reacted during the ST determination (observed NO_2^- residual was quantified $\sim 90\ \mu g/L$, i.e., much more was formed during the UV/AOP) and of initial organic compounds originally present in the well blend ($\sim 10,000\ s^{-1}$) and added to the sample (e.g., 1,4-dioxane; $ST\sim 6,360\ s^{-1}$). This highly simplified interpretation of the available data indicates that (1) nitrite was likely present in the well blend used for tests 7 and 8, and (2) presumably, there was a variation in nitrite concentration in the well blend used in the tests of October 4th over time. Trojan has calculated that a ST value of $144,750\ s^{-1}$ entered into the UV PLC would have resulted in the contaminant LRs exceeding the operating target (i.e., 1.32 LR for 1,4-D & 1.27 for PCE) for runs 7 and 8. If this increased ST value (i.e., $14,750\ s^{-1}$) were to be explained by an increased nitrite concentration then that would only require an additional $19\ \mu g/L$ of NO_2^- -N. Therefore, based on the measured nitrite concentrations, it is feasible that variable nitrite levels in the UV influent water could explain the lower treatment efficiency observed for tests 7 and 8. As previously stated, typical operation of the greensand filters will involve injection of sodium hypochlorite upstream of the filters and this would eliminate any contributions to the ST due to nitrite in the groundwater—i.e., the ST under the same feed water quality conditions would be proportionally lower (and hence performance would be higher).

6 CONCLUSIONS & RECOMMENDATIONS

This report documents the on-site performance tests for the TrojanUVFlex200 AOP system installed at the Santa Monica Arcadia Water Treatment Plant. All tests were completed with combinations of wells SM-8 and SM-9 and using UV Train 2. Whereas the test matrix states that UV Train 1 will be tested an issue with the Train 1 outlet valve control resulted in the switch to test Train 2. The design and performance of the two parallel trains are considered to be identical, which is the basis for only testing one train. The background UVT (i.e., pre- H_2O_2) of the tested water ranged from 93.0% to 98.7% and the UV influent H_2O_2 concentrations ranged from 22 to 39.7 mg/L. 1,4-dioxane log reductions from 1.1 to 3.75 were demonstrated, along with PCE log reductions of 1.06 to >2.03 and TCE log reductions of 1.73 to >1.91.

The key conclusions drawn from the performance test are:

- The specified water quality and operating conditions as defined in the test matrix were met for each test. Specifically, the measured flow rates were all within the acceptable range; the measured UV influent background UVT values were within the expected range; the measured UV influent H_2O_2 concentrations were all less than the maximum allowed; 1,4-dioxane was spiked sufficiently to produce effluent concentrations above the MDL for all tests; and the measured UV influent STs were less than the PLC-entered design value.
- The test results clearly demonstrate that the TrojanUVFlex200 UV-AOP system is capable of meeting the guaranteed treatment criteria at the design operating conditions,

as summarized in Table 2-1. Specifically, tests 1, 2 and 3 were all operated at the design conditions and at 84% BPL to simulate the lamp output at the EOLL value of 0.86 and the measured 1,4-dioxane LR values averaged 3.6, which significantly exceeded the design LR of 2.4. These test conditions also treated the ambient concentrations of PCE and TCE to less than the MDL. While ambient TCE concentrations were sufficient to demonstrate LRs at least as high as the design LR, PCE concentrations were not high enough to show this. However, Trojan's kinetic model is able to provide conservatively predicted LRs for both PCE and TCE based on the measured LR of 1,4-dioxane. Those predicted PCE and TCE LRs were shown to exceed the required treatment at the design conditions.

- Results presented demonstrate how the system accurately calculates UV influent UVT from the sum of the measured background UVT and the UV absorbance contribution from injected H₂O₂. Similarly, it was also demonstrated that the calculation of the UV effluent UVT based on the sum of the measured background UVT and the absorbance contribution from the predicted residual H₂O₂ concentration is slightly conservative due to a slight increase in the background UVT across the reactor.
- The results demonstrate that the measured and PLC-calculated UV influent and effluent H₂O₂ concentrations are in good agreement.
- The measured 1,4-dioxane LR values exceeded the operating LR setpoints for all tests for which the 1,4-dioxane compliance LR target was either the design value of 2.4 or the reduced value of 1.8. For those runs with a 1,4-dioxane compliance target of 1.2 LR, 3 of the 4 runs demonstrated 1,4-dioxane LRs that met or exceeded the compliance LR setpoint. Test 14 did not meet the compliance target and was performed at a reduced pH for which it is suggested that the ST entered into the PLC was underestimated. Trojan has calculated that a ST value of 112,500 s⁻¹ entered into the UV PLC would have resulted in the contaminant LRs exceeding the operating target (i.e., 1.32 LR for 1,4-D & 1.27 for PCE) for those two runs. Therefore, if the plant controls the UV influent pH to 6.5 or less then it is recommended that a ST value of 112,500 s⁻¹ be entered into the UV PLC.
- The measured 1,4-dioxane and PCE LRs for tests 7 and 8 were also lower than their respective operating target setpoints. Evaluation of the greensand influent water at 9:17 AM on October 4th reveals the presence of an estimated 50 µg/L NO₂⁻-N as reported by Weck. Trojan has calculated that a ST value of 144,750 s⁻¹ entered into the UV PLC would have resulted in the contaminant LRs exceeding the operating target (i.e., 1.32 LR for 1,4-D & 1.27 for PCE) for runs 7 and 8. If this increased ST value (i.e., 14,750 s⁻¹) were to be explained by an increased nitrite concentration then that would only require an additional 19 µg/L of NO₂⁻-N. Therefore, based on the measured nitrite concentrations it is feasible that variable nitrite levels in the UV influent water could explain the lower treatment efficiency observed for tests 7 and 8. However, since typical operation of the greensand filters will involve injection of sodium hypochlorite upstream of the filters, this would eliminate any contributions to the ST due to nitrite in the groundwater. Therefore, the design ST value of 130,000 s⁻¹ is considered to be conservative during normal plant operation.

- Although 17 of 22 UV effluent PCE concentrations were less than the MDL, the predicted PCE LRs based on the measured 1,4-dioxane LRs exceed the operating setpoint for those 17 tests. Only tests 14 and 15 performed at the reduced pH had measured PCE LRs below the compliance target due to underestimated ST value entered into the PLC, as discussed above. The overall conclusion regarding PCE treatment is that the compliance LR target will be met when the correct ST value is entered into the PLC.
- Similarly, although most UV effluent TCE concentrations were less than the MDL, only tests 9 and 10 were not able to definitively demonstrate that the compliance target was met because the influent TCE concentrations were too low. However, the conservatively predicted TCE LRs based on the measured 1,4-dioxane LRs exceed the operating setpoints for those all tests except tests 14 and 15. For tests 14 and 15, the measured TCE LRs were shown to significantly exceed both the predicted LRs and the operating targets.
- The overall agreement between measured and model-predicted contaminant LRs provides a high level of confidence in the ability of Trojan's UV/H₂O₂ AOP control algorithm to accurately predict performance and ultimately to control the system to meet the target contaminant treatment objectives when the system is operated in automatic log reduction-based control.

Overall, the TrojanUVFlex200 AOP performance test results described in this report demonstrate that the system is properly designed to meet and exceed the guaranteed contaminant treatment objectives. The data presented has also shown that select calculations used for the automatic control system are accurate based on measured results, and this provides confidence that the system can reliably operate over a broad range of flows, water qualities and treatment targets.
