List of Abbreviations

µg/L	micrograms per liter	NTU	nephelometric turbidity unit(s)
µS/cm	microsiemens per centimeter	ORP	oxidation reduction potential
AI	aggressive index	PCE	tetrachloroethene
AWTF	advanced water treatment facility	PFOA	Perfluorooctanoic acid
AWWA	American Water Works Association	PLC	programmable logic controller
BDL	below detection limit	PO ₄	phosphate
BDLR	below detection limit for the purpose of reporting	RO	reverse osmosis
CaCO ₃	calcium carbonate	RSD	relative standard deviation
CCPP	calcium carbonate precipitation potential	SDI	silt density index
City	City of Santa Monica	ST	Scavenging term
Cl ₂	chlorine	TCE	trichloroethylene
COPC	constituent of potential concern	TOC	total organic compound
DDW	Division of Drinking Water	TON	threshold odor number
EBCT	empty bed contact time	UV	ultraviolet
EPA	Environmental Protection Agency	UV-AOP	ultraviolet advanced oxidation process
Fe	iron	UVT	ultraviolet transmittance
FRRO	flow reversal reverse osmosis	VFD	variable-frequency drive
ft ²	square foot/feet	w.c.	water column
GAC	granular activated carbon	WTP	Water Treatment Plant
gfd	gallons per sqft per day (membranes)		
gpm	gallon(s) per minute		
H ₂ O ₂	hydrogen peroxide		
HMI	human-machine interface		
LR	log removal		
LSI	Langlier saturation index		
MCL	maximum contaminant level		
MCLeq	maximum contaminant level equivalent		
MDL	method detection limit		
meq/L	milliequivalents per liter		
mg/L	milligrams per liter		
mL	milliliter(s)		
MPN	most probably number		
Mn	manganese		
MRL	method reporting limit		
N	nitrogen		
NA	not applicable		
ND	non-detect		
ng/L	nanograms per liter		

Executive Summary

This document reports the results of acceptance testing conducted by Walsh and Brown and Caldwell on the City of Santa Monica's (City) expanded Arcadia Water Treatment Plant (WTP) and new Olympic Advanced Water Treatment Facility (AWTF) in accordance with the Acceptance Test Plan submitted to the City and the California State Water Resources Control Board, Division of Drinking Water (DDW). The testing was done to verify that the new and existing treatment units met the operational and performance criteria for treating different sources of groundwater, including advanced treatment processes such as ultraviolet advanced oxidation process (UV-AOP), granular activated carbon (GAC), flow-reversal reverse osmosis (FRRO), and decarbonation.

Acceptance testing was completed in two parts:

1. Performance testing of new and modified treatment units (covered in Sections 2 and 3).
2. Followed by the 7-day acceptance test (covered in Section 4).

The objective of the performance test was to demonstrate each treatment unit (i.e., greensand filters, UV-AOP, GAC, and FRRO) achieved performance requirements across anticipated range of treatment conditions and performance guarantees specified in Exhibit 6. The objective of the 7-day acceptance test was to demonstrate the AWTF and the FRRO system could operate in concert and produce finished water that complies with drinking water standards.

UV/AOP Performance Test Performance

Overall, the UV-AOP system achieved the 1,4-dioxane compliance log removal setpoint and programable logic controller (PLC)-predicted log removal for all tests under design conditions with a 2.4-log removal target, scavenging term (ST) of 130,000 s⁻¹, ultraviolet transmittance (UVT) greater than 96 percent, and flow ranging from 1,000 to 2,000 gpm for all flow blends. A summary of the performance criteria and compliance is provided in Table ES-1. Based on the testing results, the Design-Build team recommends the City use the Trojan UV "Dynamically Adjusted Control Algorithm" approach with a variable lamp power and hydrogen peroxide dose. Compliance setpoints of 2.4-log removal for 1,4-dioxane, 2.2-log removal for trichloroethylene (TCE), and 2.3-log removal for tetrachloroethene (PCE) should be used with design scavenging term of 130,000 s⁻¹ when operating at ambient influent pH. It is recommended that the system operates with an operational log removal setpoint of 10% greater than the compliance log removal setpoint (i.e., 1.1 safety factor).

Table ES-1. Olympic AWTF Operational and Treatment Performance Compliance

Test	Parameter	Criteria	Compliance
Greensand performance test	Iron	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^a
	Manganese	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^a
UV-AOP performance test	1,4-dioxane	≥ 2.4-log removal	Achieved for all design conditions ^b
	TCE	≥ 2.2-log removal	Achieved for all conditions
	PCE	≥ 2.3-log removal	Achieved for all design conditions ^c
	Total flow	2,000 gpm	Achieved
	UVT	≥ 96%	Achieved
	UV system power	329 kW	Final Trojan report pending
	H ₂ O ₂ Dose	Maximum H ₂ O ₂ dose of 40 mg/L	Achieved
GAC performance test	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect	Achieved
	COPCs	Document treatment performance	Documented
	Loading rate	≤ 5.9 gpm/ft ²	Achieved
	EBCT	≥ 5 minutes	Achieved
	Headloss	≤ 10-inch w.c./ft bed depth	Achieved

- a. The City's Fe and Mn combined target concentration of ≤ 0.06 mg/L was achieved for all conditions except C2. Lower concentrations are expected when well sodium hypochlorite chemical feed systems are operational.
- b. Test 14 did not achieve the 1,4-dioxane log removal compliance setpoint of 1.2-log. This test condition was set below the design criteria log removal setpoint of 2.4-log.
- c. Tests 14 and 15 did not achieve the PCE log removal compliance setpoint of 1.15-log. This test condition was set below the design criteria log removal setpoint of 2.3-log. Test 10 was identified as an anomalous result.

FRRO Performance Test Performance

The FRRO system met performance goals. RO Trains 2, 3, and 4 were operated at the maximum design flow of 1,900 gpm at the specified antiscalant dose during the FRRO performance test. A summary of the performance compliance is provided in Table ES-2.

Table ES-2. FRRO Operational and Treatment Performance Compliance

Parameter	Criteria	Compliance
System Recovery	90%	Train 2 and Train 3 achieved; Train 4 operated to 88% per agreed-upon goals
Feed Flow Range, per Train	1,650 to 1,900 gpm	Achieved
Feed Water pH	≥ 6.6	Achieved
Antiscalant Dose	2.4 to 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)	Achieved
COPCs and Background Water Quality	Document treatment performance	Documented

7-Day Test Operational and Treatment Performance Compliance

The 7-day acceptance test was conducted from February 12, 2024 through February 18, 2024 and confirmed that UV-AOP, GAC, and FRRO systems satisfy treatment and operational performance criteria during full operation of the expanded Arcadia WTP and Olympic AWTF. A summary of the 7-day acceptance test operational and treatment performance compliance is provided in Table ES-3.

Table ES-3. 7-Day Acceptance Test Performance Criteria			
System	Parameter	Criteria	Compliance
Greensand	Iron ^a	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^b
	Manganese ^a	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^b
UV-AOP	1,4-dioxane	≥ 2.4 log removal ^b	Achieved
	TCE	≥ 2.2 log removal ^b	Achieved
	PCE	≥ 2.3 log removal ^b	Achieved
	Total flow	2,000 gpm	Achieved
	UVT	≥ 96%	Achieved
	UV System Power	329 kW	Final Trojan report pending ^d
	H ₂ O ₂ Dose	Maximum H ₂ O ₂ dose of 40 mg/L	Achieved
GAC	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect	Achieved
	COPCs	Document treatment performance	Achieved
	Loading Rate	≤ 5.9 gpm/ft ²	Achieved
	EBCT	≥ 5 minutes	Achieved
	Headloss	≤ 10-inch w.c./ft bed depth	Achieved
FRRO	System Recovery	90%	Achieved
	Feed Flow Range, per Train	1,650 to 1,900 gpm	Achieved
	Feed Water pH	≥ 6.6	Achieved
	Antiscalant Dose	2.4 – 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)	Achieved
	COPCs and Background Water Quality	Document treatment performance	Achieved
Decarbonator	Carbon Dioxide	≤ 12 mg/L in effluent	Achieved
	Flow Rate	2,800 gpm (max)	Achieved
	Liquid Loading Rate	29.6 gpm/ft ² (max)	Achieved

Table ES-3. 7-Day Acceptance Test Performance Criteria

System	Parameter	Criteria	Compliance
Arcadia WTP Final Effluent (Arcadia Reservoir Effluent)	Organic Constituents	Exhibit 6, Table 3	Achieved ^c
	Inorganic Constituents	Exhibit 6, Table 4	Achieved
	DDW Water Quality Standards	MCL _{eq} < 1 ^b	Achieved
	pH	8.0 to 8.5	Achieved for 4 of the 7 days. Additional RO bypass evaluation will be conducted to achieve City finished water targets
	Total Dissolved Solids	350 to 500 mg/L	TDS was below the target range. Additional RO bypass evaluation will be conducted to achieve City finished water targets
	Turbidity	0.1 to 0.2 NTU	Achieved
	Alkalinity	75 - 150 mg/L as CaCO ₃	Day 5 and Day 6 were below target alkalinity. Additional RO bypass evaluation will be conducted to achieve City finished water targets
	Fluoride	0.5 to 1.0 mg/L	Achieved
	LSI	-1 to 1	Achieved
CCPP	None	N/A. For informational purposes only.	

- a. Iron and manganese criteria concentrations are based on feed water quality requirements specified in RO Specifications 46 63 23 Section 2.01. The greensand filter was operated to achieve the City target greensand effluent concentrations of iron + manganese ≤ 0.06 mg/L.
- b. Log removal criteria based on potential, future treatment plant influent concentrations.
- c. All organic treated water quality requirements were achieved during the 7-day acceptance test, except for TCE on Day 1. High TCE concentrations were contributed from Charnock WTP source water and not Olympic AWTF with all samples below method reporting limit in the GAC effluent samples.
- d. Design log removal goals were achieved at design operating conditions. Final Trojan power measurements pending.

MCL_{eq} = maximum contaminant level equivalent calculated by the sum of each contaminant in the fully treated water divided by its respective maximum contaminant level (MCL) or notification level (where applicable), which must be less than 1.

Treatment performance compliance criteria were achieved for the greensand, UV-AOP, GAC, FRRO, and decarbonator treatment systems. All Arcadia final effluent samples achieved primary maximum contaminant levels (MCLs), secondary MCLs, action levels, notification levels, and a COPC (maximum contaminant level equivalent (MCL_{eq}) of less than 1.

Arcadia specific finished water performance criteria were achieved for inorganic constituents (Exhibit 6, Table 4) and organic constituents (Exhibit 6, Table 3), except for a detection of TCE at 0.56 µg/L on Day 1. TCE concentrations observed in the RO feed water were contributed by Charnock WTP source water with all Olympic GAC effluent samples being non-detect. Some effluent water quality performance parameters (Exhibit 6, Table 5) were not achieved for all sample days: pH values exceed the target range for three of the seven days; TDS was below the target range on all days; and, alkalinity was below the target range on two of the seven days at the bypass percentage used during the 7-Day test. The Design-Builder will develop an additional, more detailed water quality profile of a range of bypass blend scenarios during the 30-day test following permit amendment approval by the DDW and refine the blend control strategy and demonstrate the system's ability to consistently meet the range of water quality goals.

Section 1

Acceptance Test Overview

1.1 Overview

Brown and Caldwell conducted acceptance testing on the City of Santa Monica (City) expanded Arcadia Water Treatment Plant (WTP) and Olympic Advanced Water Treatment Facility (AWTF) in accordance with the Acceptance Test Plan submitted to the City and the California State Water Resources Control Board, Division of Drinking Water (DDW). Acceptance testing was conducted to demonstrate compliance with operational and treatment performance criteria of the new and modified treatment units, including re-piping of the greensand filters to treat the existing flow (fed by the Charnock and Arcadia wells) separate from the new Olympic well water source, an ultraviolet advanced oxidation process (UV-AOP), granular activated carbon (GAC), flow-reversal reverse osmosis (FRRO), and the addition of a decarbonation tower (decarbonator).

Acceptance testing was completed in two parts:

1. Performance testing of new and modified treatment units (covered in Sections 2 and 3).
2. Followed by the 7-day acceptance test (covered in Section 4).

The objective of the performance test was to demonstrate each treatment unit (i.e., greensand filters, UV-AOP, GAC, and FRRO) achieved performance requirements across anticipated range of treatment conditions and specified performance guarantees. The objective of the 7-day acceptance test was to demonstrate the AWTF and the FRRO system could operate in concert and produce finished water that complies with drinking water standards. An outline of the performance test and 7-day acceptance test compliance criteria is summarized in Table 1-1.

1.2 Compliance Points

Monitoring locations and sample locations for each of the processes is provided in Table 1-2. An illustration of the Arcadia WTP process flow diagram is provided in Figure 1-1.

Table 1-1. Acceptance Testing Overview			
Test	Purpose	Task	Compliance
Olympic AWTF Performance Test	Demonstrate UV-AOP and GAC treatment units achieve operational and performance criteria	Greensand Performance Test	<ul style="list-style-type: none"> Iron (Fe) ≤ 0.3 milligrams per liter (mg/L) in greensand effluent Manganese (Mn) ≤ 0.05 mg/L in effluent Target combined Fe & Mn ≤ 0.06 mg/L for RO feed requirements^a
		UV-AOP Performance Test ^b	<ul style="list-style-type: none"> 1,4-dioxane ≥ 2.4-log removal Trichloroethylene (TCE) ≥ 2.2-log removal Perchloroethylene (PCE) ≥ 2.3-log removal Total flow 2,000 gallons per minute (gpm) UVT ≥ 96% Ultraviolet (UV) system maximum power 329 kW Hydrogen peroxide (H2O2) maximum dose 40 mg/L
		GAC Performance Test	<ul style="list-style-type: none"> Quench residual H2O2 to non-detect Document contaminants of potential concern (COPC) treatment performance Loading rate ≤ 5.9 gpm/per square foot (gpm/ft²) Empty bed contact time (EBCT) ≥ 5 minutes Headloss ≤ 10-inch water column per foot (w.c./ft) bed depth
FRRO Performance Test	Demonstrate modified RO system can operate in FRRO configuration and achieve operational and performance criteria.	FRRO Performance Test	<ul style="list-style-type: none"> System recovery ≥ 90% Feed flow range (per train) 1,650 – 1,900 gpm Antiscalant dose 2.4 – 4.5 mg/L (Avista Vitec-4000) or 0.8 – 1.2 mg/L (AWC A-119) Feed water pH goal ≥ 6.6 Document COPC treatment performance
7-Day Acceptance Test	Demonstrate 7-day continuous operation of all new and modified treatment units and comply with operational and treatment performance criteria.	7-Day Acceptance Test	<ul style="list-style-type: none"> Greensand performance test criteria UV-AOP performance test criteria GAC performance test criteria FRRO performance test criteria Decarbonator carbon dioxide (CO₂) ≤ 12 mg/L in effluent Decarbonator maximum flow rate 2,800 gpm Decarbonator maximum loading rate 29.6 gpm/ft² Arcadia WTP final effluent water quality Organic constituents (Exhibit 6, Table 3) Inorganic constituents (Exhibit 6, Table 4) DDW Water Quality Standards, Maximum Contaminant Level equivalent (MCLeq) ≤ 1 Arcadia major effluent water quality (Exhibit 6, Table 5)

Note. Criteria should be achieved within all system design criteria (i.e., flow rate, ultraviolet transmittance (UVT), other anticipated water quality) per Exhibit 6 and Specifications 46 63 23.

a. Iron and manganese criterion is based on feed water quality requirements specified in reverse osmosis (RO) Specifications 46 63 23 Section 2.01. The greensand filter was operated to achieve the City’s target greensand effluent concentrations of iron + manganese of ≤ 0.06 mg/L.

b. UV-AOP performance criteria reflect requirements specified in Exhibit 6, Section 6.1 and Specification 44 66 13 in Table 2. Design criteria in Specification 44 66 13.

MCLeq = maximum contaminant limit equivalent calculated by the sum of each contaminant in the fully treated water divided by its respective maximum contaminant level or notification level (where applicable), which must be less than or equal to 1.

Table 1-2. Monitoring and Sample Compliance Points

System	Sample Locations	Sample Label	Purpose
Olympic Greensand Filter	Olympic Well Blend	S4	Monitor greensand performance to meet UV-AOP and RO pretreatment requirements
	Greensand Effluent	S8	
UV-AOP	UV-AOP Feed	S9	Confirm UV-AOP operational and treatment performance
	UV-AOP Effluent ^a	S10	
GAC	GAC Lead Vessel Effluent ^b	S23	Confirm GAC operational and treatment performance
	GAC Lag Vessel Effluent	S11	
Charnock/Arcadia Wells Greensand Filter	RO Feed from Charnock/Arcadia Well Stream	S7	Monitor RO feed water quality from Charnock WTP/Arcadia well stream
RO Feed Tank	Combined RO Feed (post cartridge filter)	S14	Confirm FRRO operational and treatment performance
RO Skids	RO Skid Permeate	S15	
	RO Combined Permeate	S24

1.3 Confirmation of Execution in Accordance with Acceptance Test Plan

Deviations of the Olympic AWTF performance test, FRRO performance test, and 7-day acceptance test in accordance with the Acceptance Test Plan is detailed below. All other aspects were executed in accordance with the Acceptance Test Plan including:

- Confirmation of results with respect to each of the Acceptance Test Standards.
- All data measured and recorded during testing (Appendix A to Appendix E).
- Confirmation of results with respect to 1,4-dioxane, TCE and PCE by the UV-AOP (Section 2).
- Confirmation of RO recovery performance (Section 3 and 4) and Arcadia WTP final potable water quality (Section 4).
- Record of equipment outages, failures, and preventative maintenance (Section 2, Section 3, Section 4).
- Summary of test results and conclusive evidence of compliance with all test requirements (Section 2, Section 3, Section 4)
- All calculations used in determining test results.
- Testing was operated properly with normal complement of employees to execute acceptance testing.
- Testing was compliant with all applicable governmental approvals at all times.
- Testing operations was consistent with project criteria specified in Exhibit 6, Section 5.1.
- Testing was operated with automated and computerized systems in full and continuous operation, as specified in detail in following sections.

1.3.1 Olympic AWTF Performance Test

Table 1-3 provides a summary of deviations from the Olympic AWTF performance test. Processes are discussed in more detail in Section 2.

Table 1-3. Deviations from the AWTF Performance Test Plan		
Item	Condition	Description
SM-4	All	Olympic well SM-4 was not in operation during the performance test period. Well blends according to the AWTF Performance Test Plan were adjusted based on available operational Olympic wells (i.e. SM-8 and SM-9). Confirmation of this deviation with DDW was received during the DDW meeting on August 9, 2023.
Hydrogen peroxide system malfunction	Test 10	The hydrogen peroxide system malfunctioned during test 10 causing manual shutdown of the UV-AOP system. The hydrogen peroxide system was fixed, and Test 10 was retested in manual mode simulating specified test conditions.
GAC Train 1 and Train 2	All	GAC train 1 was in operation and was collected for COPCs for all test conditions. Flow was also passed through train 2 for test conditions with flow greater than 1,000 gpm. GAC trains are identical; thus, results from train 1 are representative of all other GAC trains.

1.3.2 FRRO Performance Test

Table 1-4 provides a summary of deviations from the FRRO performance test. Processes are discussed in more detail in Section 3.

Table 1-4. Deviations from the FRRO Performance Test Plan		
Item	Condition	Description
RO Train 1	Test 1	RO Train 1 retrofit was still under construction and consequently was not available during FRRO performance testing.
RO Train 4	Test 4	RO Train 4 was operated at 88% recovery due to an issue with scaling observed in the brine line.
Arcadia Wells	All	Arcadia wells were not in operation during FRRO performance testing. All conditions were conducted with a blend of Charnock WTP and Olympic AWTF water.

1.3.3 7-day Acceptance Test

Table 1-5 provides a summary of deviations from the 7-day acceptance test. Processes are discussed in more detail in Section 4.

Table 1-5. Deviations from the 7-day Acceptance Test Plan		
Item	Duration	Description
SM-9	Days 1-7	Offline for duration of 7-day acceptance test due to VFD issues. Capacity from the Olympic AWTF was limited to 1,000 gpm from SM-8 only.
Greensand Filter 5B	Days 1-7	Unable to be placed online during the 7-day acceptance test due to operational issues with existing filtrate valves.
Greensand Filter 6B	Days 1-7	Unable to be placed online during the 7-day acceptance test due to operational issues with existing filtrate valves.
Greensand effluent free chlorine analyzer	Days 1-7	Not connected to Historian. No SCADA data available for duration of 7-day acceptance test.
Greensand effluent turbidimeter	Days 1-7	Existing turbidimeter were not functional for the duration of 7-day test. Combined effluent field grab samples were collected and analyzed for turbidity. The primary treatment objects of the greensand filters are to provide iron and manganese removal for downstream processes (i.e., UV-AOP and FRRO). Turbidity is not a treatment objective for the greensand system and does not impact successful achievement of system performance criteria (i.e., greensand is not implemented to achieve disinfection credits through turbidity removal).
UVT field meters	Day 3 & 4	Low UVT shutdown. Bubbles in the UVT field meter sample lines are suspected to be the cause of the shutdowns, and Trojan suggested installing a de-bubbler in the sample line. The system was able to be immediately restarted following the 20-minute off-spec and warmup periods. No further issues related to low UVT were encountered after installation of the de-bubbler through the remainder of the 7-day test, and there have since been no issues with bubbles causing low UVT shutdowns through the time of writing.
GAC Train 4	Day 5	Offline on 2/16/2024 due to an influent valve requiring repair.
GAC Train 2	Day 5	Shutdown on 2/16/2024 due to high feed pressure.
GAC Trains 1, 3, and 4	Days 1-7	It was discovered on 2/18/2024 that the lead and lag vessel identification were unintentionally switched for Trains 1, 3, and 4, and configuration was kept as is for the entire duration of the 7-day acceptance test. Train 2 was operated as intended with the A vessel as the lead and the B vessel as the lag through the entire 7-day acceptance test. Results in the tables have been matched appropriately.
GAC differential pressure transmitters	Days 1-7	Differential pressure readings were inaccurate throughout the 7-day acceptance test due to calibration issues. Vendor calibrated transmitters following the acceptance test period.

Table 1-5. Deviations from the 7-day Acceptance Test Plan

Item	Duration	Description
All online RO trains	Day 3	RO system was automatically shut down six times due to programmed shutdown conditions, including high pH, for a total of 2.5 hours of downtime. The RO system was manually shut down for an additional hour on the same day to troubleshoot and repair issues relating to pH controls. It was discovered that the sulfuric acid dilution panel static mixer had mechanical issues, impeding sulfuric acid flow to the RO feed injection. Short-term repairs were completed, and dilution flows were also adjusted to help stabilize pH controls.
All online RO trains	Day 4	Following completion of the Day 4 test condition sampling on 2/15/24, the RO system was manually shut down for an additional 2 hours to allow the Contractor to complete permanent repairs on the sulfuric acid dilution panel static mixer. Following repairs, RO feed pH was stable throughout the remaining duration of the acceptance test period.
High-Pressure RO Feed Pump 4	Day 7	The variable-frequency drive (VFD) on the existing High-Pressure RO Feed Pump 4 faulted, and RO Train 4 was unable to be turned on. Repairs were completed the next day. This did not affect the Day 7 test conditions since the test condition only required one RO train to be online. RO Train 2 was subsequently placed online at the same flow and recovery rate for sampling.
RO Feed Tank Monochloramine and Ammonia Analyzer	Days 1-7	Not functional for the acceptance test due to insufficient reagent levels. Reagents were purchased and replaced following the acceptance test period. Total chlorine analyzers were used to monitor chloramine residuals.
Decarbonator Train 3	Days 1-7	Out of service for the duration of the 7-day acceptance test pending Air Quality Management District permit to place the train into service. Trains 1 and 2 were sufficient to produce finished water for all test conditions.
Arcadia Wells	Days 1-7	Not online for the duration of the acceptance test.
Finished water chloramine and ammonia residual analyzer	Days 1-7	Not functional for the acceptance test due to insufficient reagent levels. Reagents were purchased and replaced following the acceptance test period. Total chlorine analyzers and grab samples were used to monitor chloramine residuals in the final effluent.

This page intentionally left blank.

Section 2

Olympic AWWTF Performance Test Results

2.1 Olympic AWWTF Performance Test Overview

The Olympic AWWTF Performance Test was conducted on September 22, 2023, and October 2, 2023 through October 5, 2023 to confirm the Olympic greensand filters, UV-AOP, and GAC systems satisfy operational and treatment performance criteria. Performance testing included two control conditions 20 test conditions evaluating various flow rates, Olympic well blends, and operational setpoints. Operational and water quality parameters were monitored at each unit process (greensand filters, UV-AOP, GAC). A summary of the operational and treatment performance criteria is provided in Table 2-1. The planned Olympic AWWTF Performance Test conditions presented in the Arcadia WTP Acceptance Test Plan is provided in Table 2-2.

Table 2-1. Olympic AWWTF Operational and Treatment Performance Criteria

Test	Parameter	Criteria
Greensand performance test	Iron ^a	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)
	Manganese ^a	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)
UV-AOP performance test ^b	1,4-dioxane	≥ 2.4-log removal
	TCE	≥ 2.2-log removal
	PCE	≥ 2.3-log removal
	Total flow	2,000 gpm
	UVT	≥ 96%
	UV system power	329 kW
	H ₂ O ₂ dose	Maximum H ₂ O ₂ dose of 40 mg/L
GAC performance test	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect
	COPCs	Document treatment performance
	Loading rate	≤ 5.9 gpm/ft ²
	EBCT	≥ 5 minutes
	Headloss	≤ 10-inch w.c./ft bed depth

Note. Criteria should be achieved within all system design criteria (i.e., flow rate, UVT, other anticipated water quality) per Exhibit 6 and Specifications 46 63 23.

- a. Iron and manganese criterion is based on feed water quality requirements specified in RO Specifications 46 63 23 Section 2.01. The greensand filter was operated to achieve the City's target greensand effluent concentrations of iron + manganese of ≤ 0.06 mg/L.
- b. UV-AOP performance criteria reflect requirements specified in Exhibit 6, Section 6.1 and Specification 44 66 13 in Table 2. Design criteria in Specification 44 66 13.

Log R = log removal

a. Values shown for test conditions under "Auto" Mode are predicted based on Trojan algorithm for influent water quality and log removal setpoints.

b. Scavenging term (ST) will be set at 130,000 s⁻¹ ("design" value) per manufacturer specification or the "measured" value from preliminary well sampling ST results.

c. Collect source water monitoring sample.

amb = ambient

2.2 Operational and Performance Test Conditions

The test conditions executed during the Olympic AWTF performance test are presented in Table 2-3. As discussed with DDW on August 9, 2023, the Olympic well SM-4 is no longer operable and is planned for replacement. The production capacity of SM-4 is less than 100 gpm and upon inspection, it was discovered that a hole was blown in the well casing and that the C-Zone and below was completely blocked. As a result, SM-4 was not in operation during the performance testing period. The Olympic well blends for SM-8 and SM-9 were adjusted to accommodate the loss of flow from SM-4. Further details about the operational test conditions and performance for each Olympic AWTF treatment process is provided in the following sections:

- Source Water Monitoring – Section 2.3
- Greensand – Section 2.4
- UV-AOP – Section 2.5
- GAC – Section 2.6

2.3 Source Water Quality Monitoring

Source water quality samples were collected at the greensand influent sample location (S4) to monitor the incoming water quality from the Olympic well blends. Background water quality samples were collected daily for each Olympic well blend. COPC samples were collected for each unique Olympic well blend (i.e., 50 percent SM-8 and 50 percent SM-9, 100 percent SM8, and 100 percent SM-9). A summary of the source water quality for the Olympic AWTF performance test is provided in Table 2-4. Analytical results for Olympic AWTF performance test are reported to the analytical method detection limit (MDL) to provide more precise quantification of treatment performance for each treatment process. Results presented may be below the analytical method reporting limit (MRL), shown with a “J” qualifier, and below DDW detection limits for the purpose of reporting (DRL), as reported in the 7-day acceptance test (Section 4).

Table 2-3. Olympic AWTF Operational Conditions

Test No.	Olympic Well Blend (gpm)			Total Flow Rate (gpm)	Greensand Units in Operation	UV-AOP System ^a											GAC Units in Operation

- a. Result exceeded the quantifiable concentration of method resulting in greater than value. Reevaluation of sample with greater dilution would result in analysis outside of method hold time.
 - b. This value is above the values used in the initial and contingency design estimated in the Step 4 report (34 and 71 µg/L for the highest well, SM-4, respectively); however higher (than design) removal was demonstrated during the UV-AOP performance test and complete removal was achieved during the 7-day acceptance test, as described in Section 4.5.
 - c. Recommended MRL per DDW ([1,4-Dioxane | California State Water Resources Control Board](#))
- µg/L = micrograms per liter
 AWWA = American Water Works Association
 BDL = below detection limit (of reported analytical method)
 CaCO₃ = calcium carbonate
 CCPP = calcium carbonate precipitation potential
 EPA = United States Environmental Protection Agency
 LSI = Langlier Saturation Index
 MDL = method detection limit
 mL = milliliters
 M = sample was diluted prior to analysis due to high concentration or nature of matrix interferences. The MDL and MRL were raised due to the dilution.
 MPN = most probable number
 MRL = method reporting limit
 N = nitrogen
 Ng/L = nanograms per liter
 PO₄ = phosphate
 TON = threshold odor number

2.4 Greensand Performance Test

The greensand performance test was conducted concurrently with the UV-AOP performance test to confirm anticipated pretreatment requires for iron (≤ 0.3 mg/L) and manganese (≤ 0.05 mg/L) were achieved per UV-AOP and RO Contract Specification Section 46-66-13 and Section 46-63-23, respectively. Greensand performance test conditions (i.e., well blends and flows) followed conditions established for UV-AOP performance testing detailed in Section 2.5.

2.4.1 Operational and Performance Results

A summary of the greensand performance test operational and water quality results is provided in Table 2-5. Grab samples for iron and manganese were collected for each test condition at the greensand feed (S4) and greensand effluent (S8) sample locations. Grab samples were sent to an external analytical laboratory (Weck) for analysis using EPA 200.7 and EPA 200.8, respectively.

Reported greensand feed concentrations ranged from 0.011 to 3.9 mg/L total iron and <0.00083 (ND, or non-detect) to 0.36 mg/L total manganese. All greensand effluent samples achieved the ≤ 0.3 mg/L iron and ≤ 0.05 mg/L manganese performance criteria for all test conditions. The City typically operates with a treatment goal of a combined iron and manganese concentration of <0.06 mg/L, which was achieved for all test conditions except test condition C2, which had 0.093 mg/L combined iron and manganese. The Olympic well sodium hypochlorite chemical addition system was not in operation during the performance test. Greater iron and manganese removal through the greensand system is expected with a 1-2 mg/L free chlorine residual from the Olympic wells through the greensand filters. Greensand effluent field samples for silt density index (SDI), free chlorine, and turbidity were collected daily for each unique test condition. Greensand effluent SDI ranged from 1.07 to 1.75, turbidity ranged from 0.08 to 0.45 nephelometric turbidity units (NTU), and free chlorine residual was 0 to 0.05 mg/L.

2.4.2 Documentation of System or Equipment Failures or Outages

No greensand system or equipment failures or outages were observed during the Olympic AWTF Performance Test.

- a. Olympic well SM-4 was not in operation during testing.
- b. Iron was measured using method EPA 200.7. Total iron was reported with an MDL of 0.0065 mg/L and MRL of 0.03 mg/L. Dissolved iron was reported with MDL of 0.005 mg/L and MRL of 0.03 mg/L.
- c. Manganese was measured using method EPA 200.8. Total manganese was reported with an MDL of 0.00083 mg/L and MRL of 0.05 mg/L. Dissolved manganese was reported with an MDL of 0.0027 mg/L and MRL of 0.005 mg/L.
- d. Sum of total iron and total manganese concentrations.
- e. Field samples were collected and reported for test C1.
- f. Duplicate sample was collected for this condition. The average value is reported between the two samples.
- g. Field samples were collected and reported for tests 4 and 16.
- h. Field samples were collected and reported for tests 8 and 19.
- i. Field samples were collected and reported for test 9.
- j. Field samples were collected and reported for test 11.

Cl₂ = chlorine
 BDL = below detection limit (reported by analytical method)
 Reported qualifier "J" indicates the measured concentration was below the MRL.

2.5 UV-AOP Performance Test

Performance testing of the UV-AOP system was conducted to confirm that the system operates according to the design specifications and performance requirements. The primary treatment performance requirements for the UV-AOP system are 2.4-log removal of 1,4-dioxane, 2.2-log removal of TCE, and 2.3-log removal of PCE. The test team, working with Trojan field technicians, performed 22 UV-AOP performance tests with ranging source water Olympic well blends and flow rates, feed water UVT and pH, and system inactivation setpoints. Each test began with confirmation of operational conditions and feed water quality, including verification of flow rate, H₂O₂ dosing, and UVT. The following section provides a summary of the UV-AOP performance test and results. A detailed report on the UV-AOP Performance Test was also developed by Trojan and is provided in Appendix H.

2.5.1 UV-AOP Performance Test Procedures

Prior to the UV-AOP performance test, a step tracer study was conducted at 1,000 gpm to confirm the time required to reach steady-state conditions through the UV reactor following changes to water quality test conditions. The UV tracer test injected Super Hume®, a UVT modifying organic solution, at an injection port upstream of the UV-AOP influent sampling port (downstream of H₂O₂ injection, immediately prior to the UV reactor). Grab samples at the UV-AOP influent and effluent sample ports were collected and analyzed for UVT and converted to UV absorbance (UVA), at time intervals ranging from 0.5 to 4 minutes. The UVA results in Figure 2-1 show that 3 to 4 minutes was required to reach steady state at the influent sample port and that 8 minutes were required to reach steady state at the effluent sample port. An anomalous low UVA sample at the influent sample port was recorded at 10 minutes. To be conservative, a steady-state time of 20 minutes was used for 1,000 gpm UV-AOP performance test conditions, in which influent and effluent grab samples were collected 20 minutes after the start of constant injection of Super Hume® and 1,4-dioxane stock solution. The time to reach steady state is inversely proportional to flow, steady state times of 15 and 10 minutes were used for test conditions at 1,500 and 2,000 gpm, respectively.

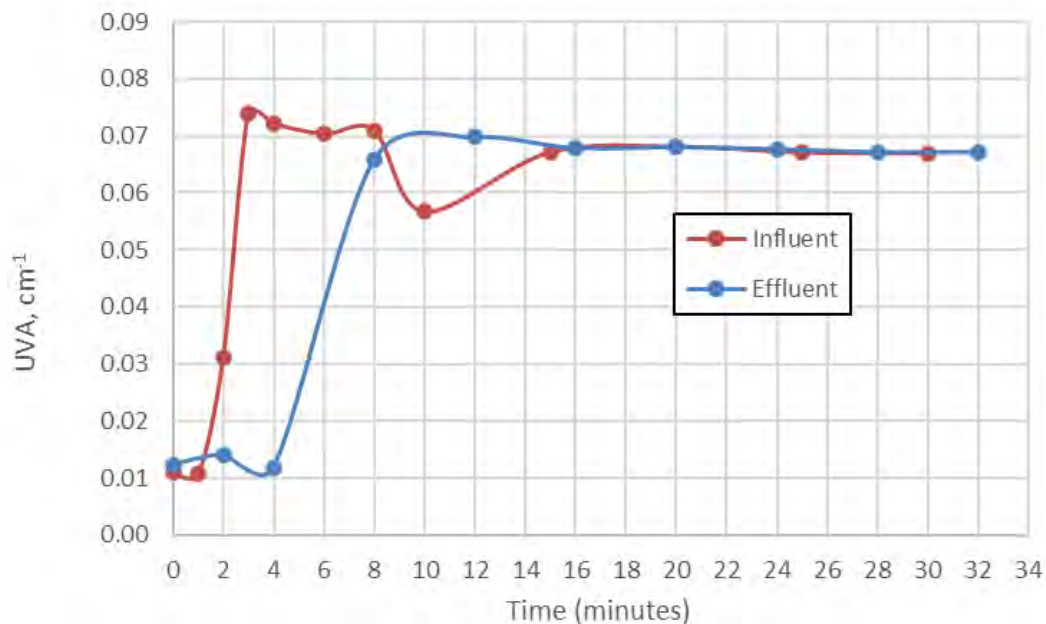

Figure 2-1. Steady-state times for UV-AOP Performance Test

1,4-dioxane was used as an indicator compound to evaluate UV-AOP treatment performance. 1,4-dioxane is a common indicator compound for UV-AOP systems, because it is not readily removed through photolysis (UV only) but is removed preferentially by hydroxyl radical oxidation (UV + H₂O₂). Additionally, 1,4-dioxane is readily soluble in water, which enables effective continuous spiking during testing to demonstrate treatment performance. Spiking higher concentrations (compared to ambient source water concentrations) of indicator compounds is necessary to fully quantify log removals across the UV-AOP system without being limited by analytical MDLs in water samples. Thus, for each UV-AOP performance test condition, 1,4-dioxane was spiked into the UV-AOP feed water. Super Hume® was fed simultaneously to achieve target UVTs. Operating conditions for each test were held constant for the steady-state period corresponding to the flow rate. Grab samples were collected at the UV-AOP influent and effluent sample ports. Samples were collected and analyzed for UVT and H₂O₂ concentration, and separate samples were sent to an external analytical laboratory (Weck) for 1,4-dioxane, PCE, and TCE analysis. At the time of sample collection, system parameters, including UV intensity, UV lamp power, treatment compliance log removal setpoints, H₂O₂ dose, and system flow rate, were recorded from the system's human machine interface (HMI).

2.5.2 Operational and Performance Results

The 22 UV-AOP performance test conditions were selected to evaluate a range of source water blends, design flows, and UVT. Additionally, various system setpoints, including ST and target log removal, were modified to better understand the ability of the UV control system to adjust to different treatment targets and water qualities while continuing to meet treatment targets. The manufacturer (Trojan) used a conservative ST of 130,000 s⁻¹ for design of the UV-AOP system during the design phase of the project. A conservative approach was taken given that there were relatively few samples collected from operating Olympic wells and analyzed for ST prior to the design phase. To measure ST in Olympic well water at a time much closer to the performance test, technicians collected and sent water samples to Trojan 3 weeks prior to performance testing to confirm water quality consistency. Trojan evaluated the ST at an unadjusted pH and at an adjusted pH of 6.5. These analyses indicated an ST of 124,000 s⁻¹ and 90,000 s⁻¹, respectively, at ambient pH and pH 6.5, which indicated that water quality was consistent and relatively unchanged since the design phase.

UV-AOP performance test conditions evaluated design ST (130,000 s⁻¹), measured ST (124,000 s⁻¹) and pH-adjusted ST (90,000 s⁻¹). Tests C1, C2, 1, 2, and 3 were conducted in manual mode, where user-defined lamp power and H₂O₂ dose were input manually. All other test conditions were operated in automatic mode, where the UV-AOP algorithm-controlled lamp power and H₂O₂ dosing concentration to achieve specified log removal compliance setpoints, based on system flow and UVT. Test 10 was the only condition that was planned to be operated in automatic mode but was conducted in manual mode; immediately prior to execution of Test 10, an emergency shutdown of the UV system was implemented. This shutdown was due to a split in the H₂O₂ chemical feed line. Following the feed line's repair, limited time was available within the daily Olympic AWTF operational window on that test day. Insufficient time was available to reboot the UV control system to operate in automatic mode. Thus, Test 10 was conducted in manual mode with user-selected lamp power and H₂O₂ dose to simulate the planned Test 10 conditions. User input values were predicted using real-time UVT values and UV control system algorithm outputs (i.e., lamp power and H₂O₂ dose) generated from the UV algorithm on a remote Trojan computer.

The original planned test matrix included flows from all three wells; however, as discussed with DDW on August 9, 2023, the SM-4 well is no longer operable and is planned for replacement. The test matrix was adjusted using Olympic wells SM-8 and SM-9 to make up the target flow source water blends. The executed UV-AOP performance test is summarized in Table 2-6 and detailed below:

- Tests C1 and C2 were control tests to confirm no treatment when the UV lamps are not operating (no power), or when no H₂O₂ is present (no oxidant dosing), respectively.
- Tests 1 and 2 were duplicate conditions completed in manual mode treating 50/50 SM-8 and SM-9 well blends at the design flow of 2,000 gpm. The UVT and H₂O₂ were set to design conditions of 96 percent and 40 mg/L, respectively. The UV lamp power was set to 84 percent to simulate end-of-lamp life and lamp fouling design conditions. The ST was entered at the design value of 130,000 s⁻¹. The system was operated in manual mode, in which the lamp power and H₂O₂ were fixed manually as described above and not via the UVFlex algorithm.
- The test conditions for Test 3 were identical to Tests 1 and 2 except that the ST was entered at the measured ST of 124,000 s⁻¹, which required a slightly lower predicted lamp power (83 percent) and H₂O₂ dose (37 mg/L) to meet treatment targets.
- Tests 4, 5, and 6 were conducted in automatic mode at design flow (2,000 gpm), design ST (130,000 s⁻¹), and design log-reduction target of 2.4-log, 2.3-log, and 2.2-log 1,4-dioxane, PCE, and TCE, respectively. Tests 4, 5, and 6 were conducted at 96 percent, 93 percent, and ambient UVT (98 to 99 percent), respectively.
- Tests 7 and 8 were conducted at 50% reduced design log-removal setpoints of 1.2-log, 1.15-log, and 1.1-log 1,4-dioxane, PCE, and TCE, respectively. Test 7 was conducted using the design ST (130,000 s⁻¹), and Test 8 was conducted using the measured ST (124,000 s⁻¹).
- Test 9 was conducted at design conditions similar to Test 6, except at reduced flow of 1,500 gpm with a 50/50 SM-8 and SM-9 blend.
- Test 10 was conducted at design conditions with reduced flow of 1,000 gpm, all from SM-9. Test 10 was conducted in manual mode simulating design log reduction targets and ST (130,000 s⁻¹). User-defined lamp power of 58.5 percent and H₂O₂ dose of 27.7 mg/L were input following predicted setpoints from the UV system algorithm (available from Trojan's remote computer).
- Test 11 followed similar flow conditions as test 10 with measured ST of 124,000 s⁻¹.
- Tests 12 and 13 were conducted with reduced flow of 1,000 gpm at design conditions similar to Tests 10 and 11, but with all flow from SM-8. Tests 12 and 13 were conducted with STs of 130,000 s⁻¹ and 124,000 s⁻¹, respectively.
- Tests 14 and 15 were conducted at 50 percent reduced log removal targets and a pH-adjusted ST of 90,000 s⁻¹. Tests 14 and 15 were operated at a design flow of 2,000 gpm, with SM-8 and SM-9 wells each providing half of the flow and pH adjusted to 6.5 and 6.6, respectively.
- Tests 16 and 17 were operated at reduced design log removal setpoints (i.e., 1.8-log 1,4-dioxane) at ambient pH and ST of 130,000 s⁻¹ and 124,000 s⁻¹, respectively.
- Tests 18, 19, and 20 were conducted at design log removal setpoints and adjusted pH of 6.5. Tests 18 and 19 were operated at design ST (130,000 s⁻¹) with ambient and 96 percent UVT, respectively. Test 20 was operated at a pH-adjusted ST of 90,000 s⁻¹ at ambient UVT.

a. In manual operation mode, log removal setpoints and STs are not input or implemented by the UV system because the UV lamp power and H₂O₂ dose are user inputs.

b. In manual operation mode, H₂O₂ residual is not predicted by the UV control system.

c. Recording of online H₂O₂ feed and residual values were inadvertently not recorded. Measured field values are reported in Table 2-7.

d. Test condition with adjust pH using sulfuric acid.

UVT and H₂O₂ Online Monitors

Grab sample UVT measurements were compared with online UVT monitor results, and measured H₂O₂ concentrations were compared to programmable logic controller (PLC)-calculated concentrations, as summarized in Table 2-7 and shown on Figure 2-2 and Figure 2-3.

Figure 2-2 shows that the online UVT measurements and grab sample measurements are in good agreement with the online monitor reading. The UV control algorithm calculates the UVT of water entering the UV-AOP system from the online UVT value and the H₂O₂ concentration in the UV-AOP feed water. The alignment with the online monitor and grab sample measurements provides confidence in the calculated method used by the system controls to predict influent UVT. Similarly, the H₂O₂ grab sample measurements and PLC-predicted concentrations demonstrated good agreement (Figure 2-3), providing confidence in the H₂O₂ dosing system and calculated influent and effluent H₂O₂ concentrations used by the UV control algorithm to predict treatment performance. Further discussion about online UVT monitors and PLC calculated H₂O₂ concentrations are presented in the Trojan Report (Appendix H).

a. PLC-calculated H₂O₂ dose is not available for manual test conditions.
 b. PLC value was inadvertently not recorded during sample collection.

This page intentionally left blank.

Feed Water Quality

Grab samples were collected throughout the UV-AOP performance test and sent to Trojan for feed water quality and hydroxyl radical ST analysis. The primary contributors to ST included alkalinity, total organic compounds (TOC), nitrate, and nitrite. For the scavenging contributed by alkalinity, pH can play a significant role when source water pH approaches the carbonic acid pK_{a1} of 6.35, resulting in a reduction of bicarbonate concentration in favor of carbonic acid. With bicarbonate exhibiting a greater scavenging demand, reducing feed water pH will result in a decrease in hydroxyl radical scavenging.

A summary of feed water quality and scavenging reported by Trojan is provided in Table 2-8. At ambient pH conditions, the UV-AOP feed water ST ranged from 86,250 to 128,000 s^{-1} across the SM-8 and SM-9 source water blends. The lowest measured ST of 85,300 was measured in the reduced pH UV-AOP feed water sample. The measured grab sample pH at the Trojan laboratory was higher (6.96) compared to the onsite pH (6.5) during the PT-UV20 test condition, due to the time between sample collection and analysis at the Trojan laboratory (i.e., shipping time). Thus, the on-site ST is expected to be lower than the measured ST from the Trojan laboratory. Further discussion about feed water quality and measured hydroxyl radical scavenging is detailed in the Trojan Report (Appendix H).

1,4-dioxane Log Removal Treatment Performance

1,4-dioxane measurements were collected in duplicate samples at the UV influent and effluent sample locations. Table 2-9 summarizes measured 1,4-dioxane concentrations and calculated relative standard deviation (RSD) between the duplicate samples. Average log reductions were calculated based on the average influent and average effluent concentrations for each test condition. All 1,4-dioxane samples concentrations were above the analytical MDL (0.028 µg/L), which enabled quantifiable log removal values to be reported for each test condition. The RSD for UV influent samples ranged from 0 to 25 percent and were all considered to be acceptable; however, the RSD for the UV effluent samples ranged from 0 to 108 percent with effluent results for Tests 6 and 16 having RSD values above 100 percent. Test 16 UV effluent replicates reported 1,4-dioxane concentrations of 0.32 and 2.4 µg/L. Given that Test 17 was operated at identical conditions to Test 16 except at a lower ST of 124,000 s⁻¹, Test 16 is expected to achieve greater log removal relative to Test 17. Thus, it is recommended to consider the 2.4 µg/L measurement for Test 16 as an anomalous result and rely on the 0.32 µg/L measured value for log removal evaluations (shown in parenthesis in Table 2-9). Similarly, it is recommended to consider the Test 6 elevated replicate measurement of 2.2 µg/L as an anomalous result and use the 0.37 µg/L measured value for log removal evaluations. All other UV effluent samples' duplicate measurements had an RSD of 0 to 34 percent and were considered acceptable.

Comparison of 1,4-dioxane-measured log removals and the UV system compliance, operational, and predicted log removal values are illustrated in Figure 2-4. The blue bars represent the measured 1,4-dioxane log removals for each test condition, with black arrows above Tests 6 and 16 indicating the true measured log removals should be 3.00 and 3.08, respectively, as discussed above. The compliance and operating log removal targets are shown in the red and green bars, respectively. Compliance log removal setpoints were input according to each test condition (Table 2-6), and operational log removal setpoints were set to be 10 percent higher than the compliance level. The PLC-predicted log removal is shown with the purple bar. The PLC-predicted log removals are calculated using real-time, online measurements of flow, UVT, H₂O₂ dose, UV lamp power, and entered ST. PLC-predicted log removals are not available for manual test conditions (i.e., Tests C1, C2, 1, 2, 3, and 10). Additionally, log removal setpoints for manual mode are irrelevant since the PLC is not controlling operations (i.e., UV power or H₂O₂ dose).

Figure 2-4 also demonstrates that the UV system exceeded the target and predicted log removal values for all tests except Tests 7, 8, 14, and 15. For those four tests, which had reduced log removal compliance targets, Tests 7, 8, and 15 met the compliance target of 1.2-log but did not achieve the operational target of 1.32-log. Test 14 achieved 1.1-log removal compared to the 1.2-log compliance target. Tests 14 and 15 had identical test conditions with reduced pH to 6.5 - 6.6 and a lower ST setpoint of 90,000s⁻¹. Test 15 resulted in measured 1,4-dioxane log reduction of 1.22-log compared to Test 4 log reduction of 1.10-log. This relatively minor discrepancy is likely due to analytical uncertainty as the range of log removal calculations from both sets of analytical data (i.e., replicates from Tests 14 and 15) is from 1.0 to 1.4.

Overall, the UV-AOP system achieved the system performance requirements, meeting the 1,4-dioxane compliance log removal setpoint and PLC-predicted log removal for all tests under design conditions with a 2.4-log removal target, ST of 130,000 s⁻¹, UVT greater than 96 percent, and flow ranging from 1,000 to 2,000 gpm for all flow blends.

a. Operational setpoint was set 10% greater than the compliance log removal setpoint.

b. In manual operation mode, the UV control system does not provide a predicted log removal value.

c. Suspected anomalous analytical replicate result shown by the high relative standard deviation. Expected true log removal value is shown in parenthesis.

d. Average 1,4-dioxane log removal was below compliance log removal setpoint.

e. PLC predicted removal was inadvertently not recorded during sample collection.

Reported qualifier "J" indicates the measured concentration was below the MRL.

PCE Log Removal Treatment Performance

PCE was analyzed in single samples at the UV influent and effluent sample locations with approximately 10 percent of the tests (i.e., Tests 4 and 8) also collecting duplicate samples. Table 2-10 summarizes measured PCE concentrations and calculated RSD between the duplicate samples. Unlike 1,4-dioxane, PCE was not spiked during UV-AOP performance testing, which resulted in non-detect ($< 0.18 \mu\text{g/L}$) values in the UV effluent sample for 16 of the 22 tests. Calculated log removals for non-detect tests were calculated to the analytical method minimum detection limit of $0.18 \mu\text{g/L}$. It is noteworthy that PCE is removed through direct photolysis, thus PCE removal was observed for control condition 2 (Test C2), which operated with UV exposure without H_2O_2 dosing.

Comparison of PCE-measured log removals and the UV system compliance, operational, and predicted log removal values are illustrated in Figure 2-5. The dark blue bars represent the measured PCE log removals, with arrows above the bars indicating tests with measured log removals that would be higher due to the UV effluent sample being below the MDL. The compliance and operating log removal targets are shown in red and green bars, respectively. The PLC-predicted log removals are shown in the purple bars. The PLC-predicted PCE removal is typically equivalent to or slightly above the operational log removal setpoint; however, because multiple contaminant log removal treatment setpoints are implemented (e.g., 1,4-dioxane, PCE, and TCE) several test conditions had significantly higher PLC-predicted PCE log removals, due to the 1,4-dioxane operational setpoint controlling UV-AOP treatment. This resulted in the PLC-predicted PCE log removal being significantly higher than required to meet the PCE operational setpoint (as shown in Tests 9, 11, 12, 13).

As shown in Table 2-10 and Figure 2-5, it cannot be definitively concluded that the measured PCE log removal values exceeded the target and predicted values because most tests produced UV effluent PCE concentrations below the minimum detection limit. During confirmation of the UV-AOP Performance Test Plan, Trojan prepared a document titled "*Rationale for Proposing 1,4-Dioxane Removal Yield as an Indicator for Tetrachloroethene (PCE) and Trichloroethene (TCE) Removal Efficiency from Groundwater with the UV/ H_2O_2 AOP at Water Treatment Facilities.*" This document concluded that the log removal ratio for 1,4-dioxane:PCE:TCE would be 1.00:1.00:1.22 when treating the Olympic AWTF design water quality (i.e., ST of $130,000 \text{ s}^{-1}$). Using the established log removal ratios, predicted PCE log removal based on measured 1,4-dioxane log removals are shown in Figure 2-6 represented as light blue bars. These predicted values demonstrate the anticipated PCE log removals if sufficient UV influent PCE concentrations were present (and therefore, sufficient effluent PCE concentrations were subsequently present).

In runs where the PCE concentrations were NOT sufficient, the predicted PCE log removal exceeds the operating setpoint and therefore are predicted to accomplish the target log removal. In one test (Test 10) that did not meet target, the measured effluent PCE concentration was above the MDL and below the MRL and resulted in a measured log removal of 2.03 versus the compliance target of 2.3 log removal; however, it should be noted that analytical data that is below the MRL has a greater associated uncertainty. Further, inconsistencies between Test 10 results and others (e.g., Test 11, which was operated at conditions that should have resulted in a lower treatment but resulted in higher treatment levels than Test 10) lead the team to conclude that the Test 10 PCE result is anomalous. Also, Tests 7, 8, 14, and 15 did produce effluent PCE concentrations greater than the MDL, and the resulting log removals were less than the predicted log removals. For those four tests, each of which targeted a lower PCE log removal target of 1.15, two of the four tests met or exceeded the compliance target, while Tests 14 and 15 achieved 92 percent of the compliance target log removal (i.e., 1.06 vs 1.15). The predicted PCE log removal based on the measured 1,4-dioxane log removals are also lower than the operating target for all four runs and lower than the compliance

target for Test 14. However, the agreement between the measured and predicted log removals for these runs suggests that the PCE log removal predictions based on the measured 1,4-dioxane log removals are sound and that an increase in the log removal target (to the general compliance level of 2.3 log removal) will result in successful ongoing operation related to PCE removal.

Overall, the UV-AOP system produced non-detect (< 0.18 µg/L) PCE concentrations in the UV effluent for all tests under design conditions with 2.3-log removal target, ST 130,000 s⁻¹, UVT greater than 96 percent, and flow ranging from 1,000 to 2,000 gpm for all flow blends. For these test conditions, the predicted PCE log removal based on measured 1,4-dioxane log removals exceeded the compliance and operational PCE log removal setpoints.

20	UV-PT20	2.3	2.50	2.55	16	--	BDL	--	> 1.9 ^c

a. Operational setpoint was 10% greater than the compliance log removal setpoint.

b. In manual operation mode the UV control system does not provide a predicted log removal value.

c. Sample was below the PCE analytical MDL of 0.18 µg/L. Average log reduction were limited to the MDL.

d. PLC predicted removal was inadvertently not recorded during sample collection.

e. Average measurable PCE log removal was below the compliance log removal setpoint.

Reported qualifier "J" indicates the measured concentration was below the method reporting limit of 0.5 ug/L but above the method detection limit of 0.18 ug/L.

TCE Log Removal Treatment Performance

TCE was analyzed in single samples at the UV influent and effluent sample locations with approximately 10 percent of the tests (i.e., Tests 4 and 8) also collecting duplicate samples. Table 2-11 summarizes measured TCE concentrations and calculated RSD between the duplicate samples. Similar to PCE, TCE was not spiked during UV-AOP performance testing, which resulted in non-detect (< 0.18 µg/L) values in the UV effluent sample for 16 of the 22 tests. The concentration of TCE was above the values used in the initial and contingency design estimated in the Step 4 report (34 and 71 µg/L for the highest well, SM-4, respectively) in some test cases; however higher (than design) removal was demonstrated during the UV-AOP performance test and complete removal was achieved during the 7-day acceptance test, as described in Section 4.5. Calculated log removals for non-detect tests were calculated to the analytical method minimum detection limit of 0.18 µg/L. It is noteworthy that TCE can be removed through direct photolysis, thus some TCE removal was observed for control condition 2 (Test C2) operating with UV exposure without H₂O₂ dosing.

Comparison of TCE-measured log removals and the UV system's compliance, operational, and predicted log removal values are illustrated in Figure 2-6. The dark blue bars represent the measured TCE log removals, with arrows above the bars to indicate tests with measured log removals that would be higher, due to UV effluent sample measurement being below the minimum detection limit. The compliance and operating log removal targets are shown in red and green bars, respectively. The PLC-predicted log removals are shown in the purple bars. The PLC-predicted TCE removals are significantly higher than the operational log removal setpoint due to the UV system being controlled to achieve 1,4-dioxane log removal setpoints.

Tests 7, 8, 14, and 15 measured TCE concentrations above the minimum detection limit in the UV effluent samples and were able to demonstrate log removals exceeding compliance and PLC-predicted log removal values. 16 of 22 test conditions produced UV effluent TCE concentrations below the minimum detection limit of 0.18 µg/L, which limits the calculation of log removals. Nevertheless, given the higher ambient concentration of TCE in the blended source water, most of the test conditions were able to demonstrate achievement of the compliance log removal setpoint. Only tests 10 and 11 were not able to demonstrate the compliance log removal target was met because the influent TCE concentration was too low. Using the established log removal ratios 1.00:1.22 for 1,4-dioxane:TCE, predicted TCE log removal based on measured 1,4-dioxane log removals are shown in Figure 2-6 represented as light blue bars. These predicted values demonstrate that the anticipated TCE log removals would exceed target values if sufficient UV influent PCE concentrations were present.

Overall, the UV-AOP system achieved the TCE compliance log removal target under all test conditions.

a. Operational setpoint was 10% greater than the compliance log removal setpoint.

b. In manual operation mode, the UV control system does not provide a predicted log removal value.

c. Sample was below the TCE analytical MDL of 0.18 µg/L. Average log reduction was limited to the MDL.

d. PLC-predicted removal was inadvertently not recorded during sample collection.

Reported qualifier "J" indicates the measured concentration was below the MRL.

2.5.3 Recommendations for UV-AOP Operation

Based on the testing results, it is recommended that the City uses the Trojan UV “Dynamically Adjusted Control Algorithm” approach with a variable lamp power and hydrogen peroxide dose. Compliance setpoints of 2.4-log removal for 1,4-dioxane, 2.2-log removal for TCE, and 2.3-log removal for PCE should be used with design scavenging term of $130,000 \text{ s}^{-1}$ when operating at ambient influent pH. It is recommended that the system operates with an operational log removal setpoint of 10% greater than the compliance log removal setpoint (i.e., 1.1 safety factor).

The City would like to retain flexibility in the permit to modify the operating scavenging term in the future. However, the City does not plan to request the ability to operate with a reduced scavenging term at a depressed influent pH until one year or more of operation at the above recommended ambient conditions following permit amendment approval. At that time, discussion with DDW as to required data collection to demonstrate maintenance of adequate treatment at the alternative operating conditions would be discussed with DDW.

2.5.4 Documentation of System or Equipment Failures or Outages

During Test 10, a chemical feed line for the H_2O_2 system malfunctioned, which caused the shutdown of the UV-AOP system. The line was replaced, and sampling of Test 10 was conducted in manual mode due to limited daily operation time. All following UV-AOP tests were conducted in automatic mode after the PLC system was rebooted.

2.6 GAC Performance Test

The GAC performance test was conducted concurrently with the UV-AOP performance test to confirm residual H_2O_2 was quenched to non-detect levels ($< 0.2 \text{ mg/L}$). GAC performance test conditions followed conditions established for the UV-AOP performance test detailed in Section 2.5.

2.6.1 Operational and Performance Results

A summary of the GAC performance test operational and water quality results is provided in Table 2-12. Flow was split between GAC Trains 1 and 2 for test conditions at 1,500 to 2,000 gpm, which resulted in hydraulic loading rates of 6.6 to 8.8 gpm/ft². For low flow conditions at 1,000 gpm, Train 1 treated the full flow with an approximate hydraulic loading rate of 8.8 gpm/ft². Headloss through the GAC lead vessel was 3 psi or less for all test conditions. Grab samples were collected along the lead vessel media bed for each test condition and monitored for H_2O_2 residual. Additionally, grab samples were collected at the lead and lag effluent sample locations for Train 1 and sent to an external analytical laboratory (Weck) for analysis of COPCs. All four trains are identical in design and GAC age; thus, operational and water quality results from Train 1 are representative of Trains 2, 3, and 4.

GAC influent H_2O_2 residual ranged from 0 to 40.5 mg/L across the GAC performance test conditions. H_2O_2 residuals were quenched to 3 mg/L or less by the first GAC vessel sample port (top of the media bed) and were non-detect by the third GAC vessel sample port for all test conditions (Table 2-12). COPCs were non-detect in the GAC influent except for the following: 1,4-dioxane, 1,2,3-TCP, carbon tetrachloride, cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, and PFOA. 1,4-dioxane was detected below the lab MDL ($1 \mu\text{g/L}$) for test conditions 11 and 20 in the lead GAC effluent sample location. All other GAC lead and lag effluent samples were non-detect for all COPCs across the test conditions (Table 2-13).

Overall, the GAC system met the water quality and design criteria providing H_2O_2 quenching to non-detect for all test conditions.

Table 2-12. GAC Performance Test Conditions

No.	Test ID	GAC Trains Flows (gpm)					Train Sampled for COPCs	H ₂ O ₂ Residual (mg/L)								Differential Pressure (psi)

COPCs that were non-detect in the GAC feed, lead effluent, and lag effluent test include 1,1,2-Trichloroethane, 1,1-DCE, 1,2-DCA, benzene, MTBE, trans-1,2-Dichloroethene, vinyl chloride.

2.6.2 Documentation of System or Equipment Failures or Outages

Temporary discharge to the storm drain was installed post GAC, as per the Olympic AWTF Acceptance Test Plan. The lag pressure gauge was not representative of typical full-scale operation. No other GAC system or equipment failures or outages were observed during the Olympic AWTF Performance Test.

2.7 Deviation from Acceptance Test Plan

Table 2-14 provides a summary of deviations from the Olympic AWTF performance test.

Table 2-14. Deviations from the AWTF Performance Test Plan		
Item	Condition	Description
SM-4	All	Olympic well SM-4 was not in operation during the performance test period. Well blends according to the AWTF Performance Test Plan were adjusted based on available operational Olympic wells (i.e. SM-8 and SM-9). Confirmation of this deviation with DDW was received during the DDW meeting on August 9, 2023.
Hydrogen peroxide system malfunction	Test 10	The hydrogen peroxide system malfunctioned during test 10 causing manual shutdown of the UV-AOP system. The hydrogen peroxide system was fixed, and Test 10 was retested in manual mode simulating specified test conditions. Peroxide concentration was confirmed in the field.
GAC Train 1 and Train 2	All	GAC train 1 was in operation and was collected for COPCs for all test conditions. Flow was also passed through train 2 for test conditions with flow greater than 1,000 gpm. GAC trains are identical; thus, results from train 1 are representative of all other GAC trains.

2.8 Operational and Treatment Performance Compliance

The Olympic AWTF achieved all the operational and treatment performance criteria during the performance test. A summary of the performance criteria and compliance is provided in Table 2-15.

Table 2-15. Olympic AWTF Operational and Treatment Performance Compliance

Test	Parameter	Criteria	Compliance
Greensand performance test	Iron	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^a
	Manganese	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^a
UV-AOP performance test	1,4-dioxane	≥ 2.4-log removal	Achieved for all design conditions ^b
	TCE	≥ 2.2-log removal	Achieved for all conditions
	PCE	≥ 2.3-log removal	Achieved for all design conditions ^c
	Total flow	2,000 gpm	Achieved
	UVT	≥ 96%	Achieved
	UV system power	329 kW	Final Trojan report pending ^d
	H ₂ O ₂ Dose	Maximum H ₂ O ₂ dose of 40 mg/L	Achieved
GAC performance test	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect	Achieved
	COPCs	Document treatment performance	Documented
	Loading rate	≤ 5.9 gpm/ft ²	Achieved
	EBCT	≥ 5 minutes	Achieved
	Headloss	≤ 10-inch w.c./ft bed depth	Achieved

- a. The City's Fe and Mn combined target concentration of ≤ 0.06 mg/L was achieved for all conditions except C2. Lower concentrations are expected when well sodium hypochlorite chemical feed systems are operational.
- b. Test 14 did not achieve the 1,4-dioxane log removal compliance setpoint of 1.2-log. This test condition was set below the design criteria log removal setpoint of 2.4-log.
- c. Tests 14 and 15 did not achieve the PCE log removal compliance setpoint of 1.15-log. This test condition was set below the design criteria log removal setpoint of 2.3-log. Test 10 was identified as an anomalous result.
- d. Design log removal goals were achieved at design operating conditions. Final Trojan power measurements pending.

Section 3

Flow Reversal Reverse Osmosis Performance Test Results

This section presents the results of the FRRO Performance Test.

3.1 Overview of FRRO Performance Test

The FRRO performance test was conducted on February 6, 2024 and February 7, 2024 to confirm the RO system satisfies operational and treatment performance criteria summarized in Table 3-1. Each RO skid was operated in flow reversal mode with a feed flow of 1,900 gpm and monitored for operational and water quality performance. Operating setpoints were determined during the optimization process conducted prior to the start of the FRRO performance test, where the recovery rate was progressively increased from 82 percent to 90 percent. The planned FRRO performance test matrix presented in the Arcadia WTP Acceptance Test Plan is provided in Table 3-2.

Table 3-1. FRRO Performance Test Performance Criteria

Parameter	Criteria
System Recovery	90%
Feed Flow Range, per Train	1,650 to 1,900 gpm
Feed Water pH	≥ 6.6
Antiscalant Dose	2.4 - 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)
COPCs and Background Water Quality	Document treatment performance

Table 3-2. Test Plan FRRO Performance Test Matrix

Day	No.	Test ID	RO Feed Flow Rate (gpm)	Train in Operation	Target Percent Recovery	Purpose
1	1	PT-R01	1,900 per train	1	90%	Confirm design recovery at maximum RO feed flow rate
	2	PT-R02	1,900 per train	2	90%	
2	3	PT-R03	1,900 per train	3	90%	Confirm design recovery at maximum RO feed flow rate
	4	PT-R04	1,900 per train	4	90%	

Analytical results for FRRO performance test are reported to the analytical MDL to provide more precise quantification of treatment performance for each treatment process. Results presented may be below the analytical MRL shown with a “J” qualifier, and below DDW DRL, as reported in the 7-day acceptance test (Section 4).

3.2 FRRO Performance Test Results

The test conditions executed during the FRRO performance test are presented in Table 3-3. Test conditions were operated at steady state, and samples were collected at least 1 hour after initiation of new test conditions. RO Train 1 retrofit is still under construction and consequently was not available for the entirety of the FRRO Performance Test and 7-day Acceptance Test.

Day	No.	Test ID	RO Feed Flow Rate (gpm)	Train in Operation	Target Percent Recovery	Note
-	1	PT-R01	1,900 per train	1	90%	Train 1 not in operation during performance test
1	2	PT-R02	1,900 per train	2	90%	Operated for 24-hours
	4	PT-R04	1,900 per train	4	88%	Operated for 1.1-hours; shut down after collection of water quality samples triggered by individual stage high differential pressure; actual recovery was 88 percent
2	3	PT-R03	1,900 per train	3	90%	Operated for 1.7-hours; shut down after collection of water quality samples triggered by individual stage high differential pressure

The FRRO performance test period was used to verify the functionality of the RO system's mechanical equipment, programming, and controls. Due to an individual stage high differential pressure when rotating blocks, a more conservative (88 percent maximum) recovery was chosen for Train 4 water quality sampling.

3.2.1 Operational Monitoring

A summary of the FRRO performance test operational results is provided in Table 3-4. RO Train 2 was operated for 24 hours with an average feed flow rate of 1,899 gpm and operated at 90 percent recovery. Train 3 was operated for 124 minutes at 90 percent recovery, and Train 4 was operated for 68 minutes at 88 percent recovery. FRRO performance test flows and percent recovery for Trains 2, 3, and 4 are shown in Figures 3-1, 3-2, and 3-3, respectively.

Table 3-4. FRR0 Performance Test Operational Monitoring

Parameter	RO Train 2	RO Train 3	RO Train 4
Test ID	PT-R02	PT-R03	PT-R04
Start of Testing	2/6/2024 9:50	2/7/2024 12:30	2/6/2024 11:40
End of Testing	2/7/2024 9:50	2/7/2024 14:34	2/6/2024 12:48
Feed Flow Rate (gpm)	1,899	1,901	1,900
Permeate Flow Rate (gpm)	1,709	1,711	1,672
RO Bypass Setpoint (%)	15	15	15
Concentrate Flow Rate (gpm)	190	190	228
Percent Recovery (%)	90%	90%	88%
Membrane Stage 1 Flux (gfd)	13.3	13.4	12.6
Membrane Stage 2 Flux (gfd)	12.5	12.5	12.5
Membrane Stage 3 Flux (gfd)	10.6	10.7	11.8
Normalized Feed Pressure (psi) ^b	125	126	120
Normalized Permeate Flow Rate (gpm) ^b	1,016	1,634	1,553
Normalized Specific Flux (gfd/psi) ^b	0.12	0.12	0.12
Normalized Salt Passage (%) ^b	0.82%	1.01% ^c	0.63%
Antiscalant Dose (mg/L)	3.5 to 4.5 ^a	4.5	4.5

a. Antiscalant dose of Avista Vitec-4000 was increased from 3.5 to 4.5 mg/L per antiscalant chemical vendor recommendation on 2/7/2024 at 7:30 a.m. to address scaling issues observed in the brine line.

b. Normalized calculations were performed using TorayTrak, a publicly available normalization software for Toray RO membranes. <https://www.water.toray/knowledge/tool/trak/>. Note that the baseline used is the average of the first four data points following initial startup for each respective RO Train at the corresponding recovery.

c. Permeate conductivity was 52-55 $\mu\text{S}/\text{cm}$ throughout the 2 hours that it was online. The conductivity meter was likely out of calibration that day. A conductivity profile was taken the previous day and the measured field conductivity was 37.5 and the field meter read 55.4 $\mu\text{S}/\text{cm}$.

gfd = gallons per square foot per day

Antiscalant dose and process pH optimization is currently being conducted due to presence of scale in the concentrate lines. Scale mitigation measures currently being investigated include increase of antiscalant dose as described in Table 3-4, optimization of flush sequences, concentrate valve adjustments to reduce high pressure drop and evolution of carbon dioxide, and RO feed pH and antiscalant product and dosage modifications.

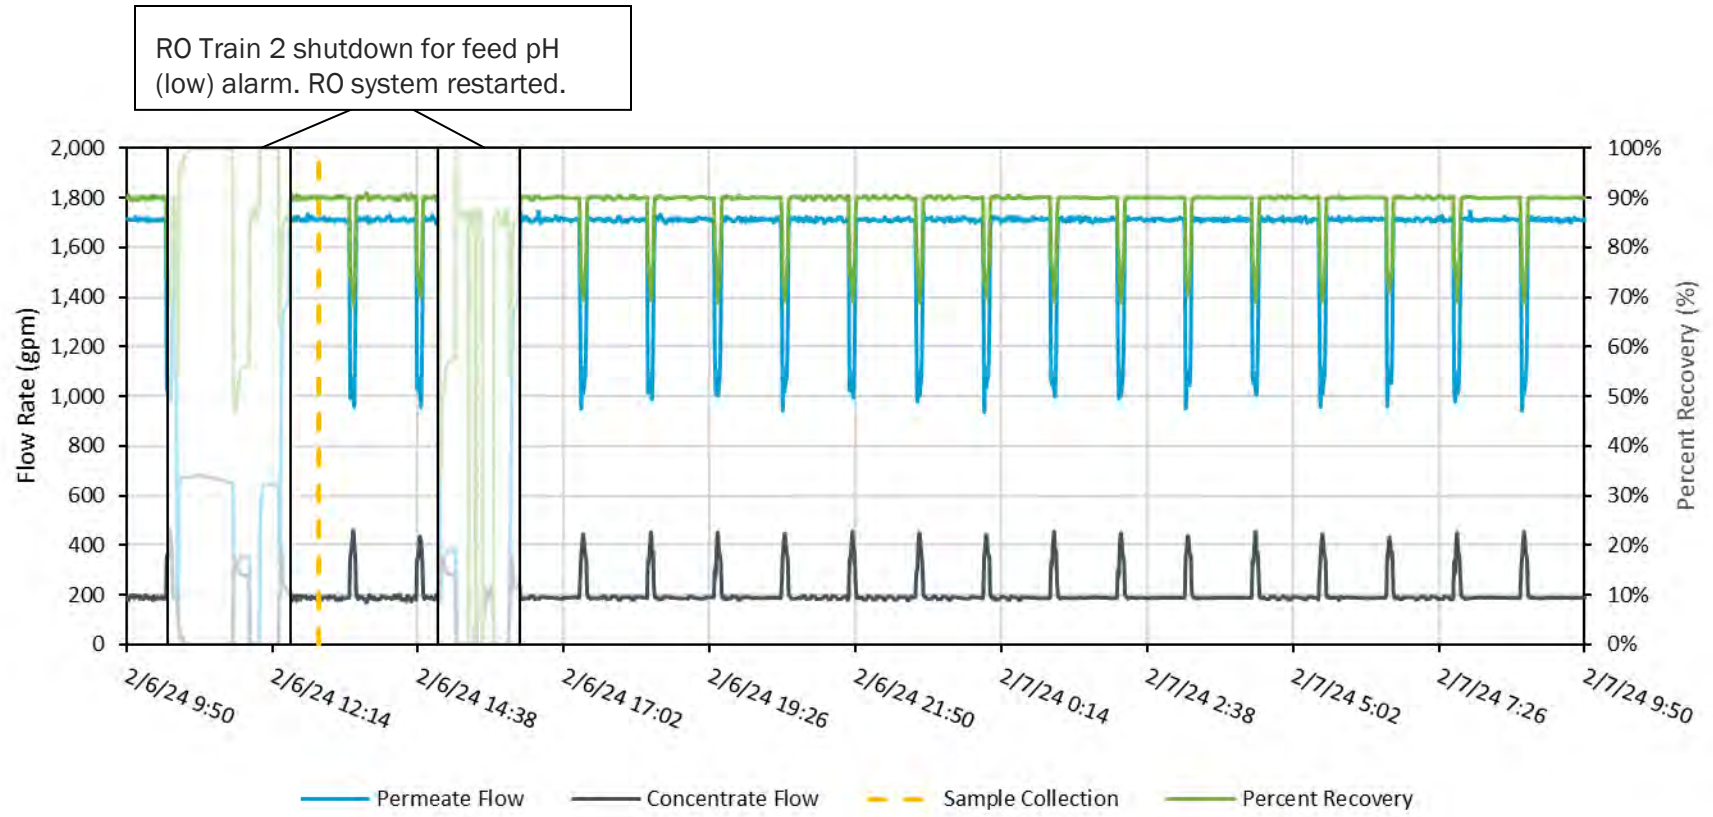

Figure 3-1. FRRO Performance test flows and percent recovery – Train 2

Figure 3-2. FRRO performance test flows and percent recovery – Train 3

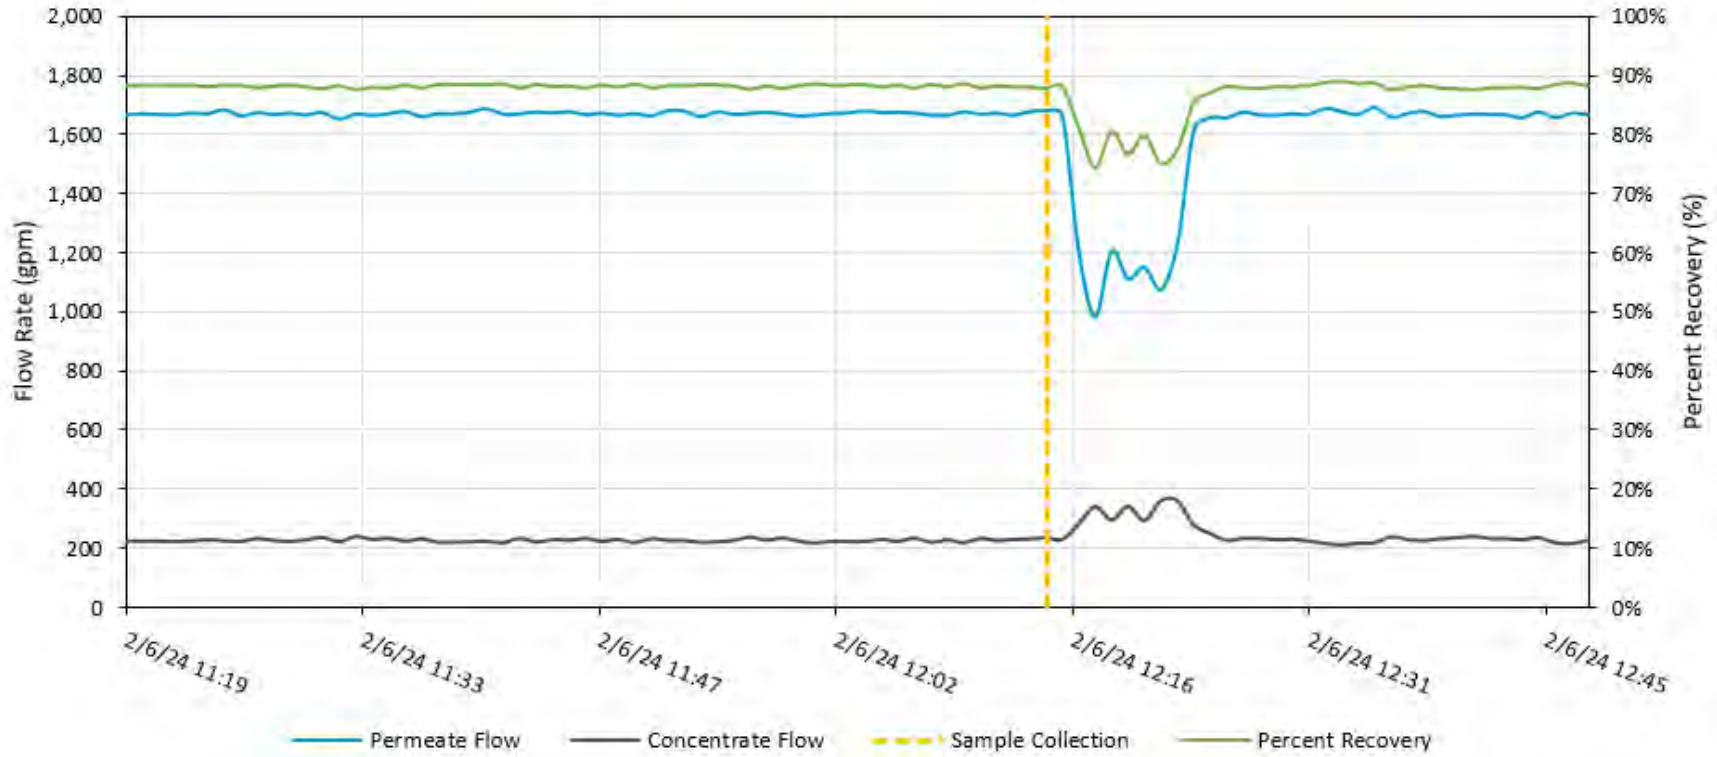

Figure 3-3. FRRO performance test flows and percent recovery – Train 4

3.2.2 Water Quality Monitoring

The FRRO performance test was conducted with blended water from the Charnock WTP and Olympic AWTF. The RO feed water quality was continuously monitored via online water quality monitors for conductivity, oxidation reduction potential (ORP), chloramine residual, turbidity, pH, and temperature. Time series plots for online RO feed water quality is presented in Figure 3-4, Figure 3-5, and Figure 3-6. On-site water quality samples were collected and analyzed using field meters to confirm treatment performance. Grab samples were also collected on the RO feed and RO permeate for each RO train and sent to an external laboratory (Weck) for analysis. A summary of water quality is provided in Table 3-5.

The design monochloramine residual for RO feed water ranges from 0.5 to 2.5 mg/L as Cl₂, with 1.0 mg/L as Cl₂ as the target dose for normal operation. As shown in Figure 3-4 the average monochloramine residual during the RO performance test was 0.6 mg/L as Cl₂. Monochloramine is an oxidant and if the membranes are exposed to high concentrations for an extended period, salt passage will increase. Thus, it is preferred to maintain the minimum monochloramine residual required for biofouling protection.

All COPCs in the RO permeate were below the method detection limit, except for 1,4-dioxane and TCE. 1,4-dioxane concentrations were reduced by approximately 90% to below the method reporting limit of 0.07 µg/L. TCE is not well removed by RO with RO permeate concentrations ranging from 1.6 - 2.4 µg/L, which is expected to be removed by the downstream decarbonator process. TCE concentrations in the RO feed water were contributed by Charnock WTP source water (Table 4-4) with GAC effluent samples resulting in non-detect during the Olympic AWTF performance test (Table 2-13) and 7-day acceptance test (Table 4-14).

a. Ammonia and chlorine-t-ammonia ratio readings were not available due to unavailability of analyzer reagents.

µs/cm = microsiemens per centimeter

M = analytical qualifier specifying sample was analyzed outside of method hold time.

3.2.3 Documentation of System or Equipment Failures or Outages

RO Train 1 retrofit was still under construction and consequently was not available for the FRRO performance test. The feed tank monochloramine and ammonia analyzer was not in operation due to missing chemical reagents. Instead, the cartridge filter effluent chloramine analyzer was used to monitor chloramine residual during performance testing.

3.3 Deviation from Acceptance Test Plan

RO Train 1 was not available for the entirety of the FRRO performance test as it was still under construction. RO Trains 3 and 4 were operated for approximately 2 hours and 1 hour, respectively, until shutdown was initiated by individual stage high differential pressure. RO Trains 3 and 4 were operated for approximately 30 minutes prior to collecting water quality samples to achieve steady state. Due to an issue with scaling observed in the brine lines, a more conservative (88 percent maximum) recovery was chosen for RO Train 4 for the FRRO performance test. Continuous operation of RO Trains 3 and 4 at 90 percent recovery were evaluated during the 7-day Acceptance Test.

The Arcadia wells were not in operation during FRRO performance testing. All conditions were conducted with a blend of Charnock WTP and Olympic AWTF water.

3.4 Operational and Treatment Performance Compliance

RO Trains 2, 3, and 4 were operated at the maximum design flow of 1,900 gpm at the specified antiscalant dose during the FRRO performance test. A summary of the performance criteria and compliance during the FRRO performance test is provided in Table 3-6.

Parameter	Criteria	Compliance
System Recovery	90%	Train 2 and Train 3 achieved; Train 4 operated to 88% per agreed-upon goals
Feed Flow Range, per Train	1,650 to 1,900 gpm	Achieved
Feed Water pH	≥ 6.6	Achieved
Antiscalant Dose	2.4 to 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)	Achieved
COPCs and Background Water Quality	Document treatment performance	Documented

Section 4

7-day Acceptance Test Results

This section reviews the outcomes of the 7-Day Acceptance Test.

4.1 Overview of 7-day Acceptance Test

The 7-day acceptance test was conducted from 2/12/2024 through 2/18/2024 to confirm that UV-AOP, GAC, and FRRO systems satisfy treatment and operational performance criteria during full operation of the expanded Arcadia WTP and Olympic AWTF. During the 7-day acceptance test period, test conditions were varied to evaluate full plant performance under anticipated treatment flows and well blends. Specified test conditions were initiated at approximately 7 a.m. each day. All Arcadia WTP and Olympic AWTF treatment processes were monitored to document operational conditions and confirm operational compliance of new and modified treatment processes. A suite of water quality samples was collected at each Arcadia WTP and Olympic AWTF treatment process to confirm treatment performance. The existing reservoir aeration system was not operated during the 7-day acceptance test as the mechanical surface aeration system was removed following DDW approval on June 23, 2023. All treated water during the acceptance test period were discharged to the reservoir, where it was subsequently pumped to the storm drain system via temporary pumps.

The 7-day acceptance test performance criteria for the new and modified treatment units are provided in Table 4-1. Each treatment process during the test period was monitored for COPCs to document removals across each treatment unit. Results for COPCs are reported to the detection limit for purposes of reporting (DLR).

Table 4-1. 7-Day Acceptance Test Performance Criteria		
System	Parameter	Criteria
Greensand	Iron ^a	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)
	Manganese ^a	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)
UV-AOP	1,4-dioxane	≥ 2.4 log removal ^b
	TCE	≥ 2.2 log removal ^b
	PCE	≥ 2.3 log removal ^b
	Total flow	2,000 gpm
	UVT	≥ 96%
	UV System Power	329 kW
	H ₂ O ₂ Dose	Maximum H ₂ O ₂ dose of 40 mg/L
GAC	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect
	COPCs	Document treatment performance
	Loading Rate	≤ 5.9 gpm/ft ²
	EBCT	≥ 5 minutes
	Headloss	≤ 10-inch w.c./ft bed depth
FRRO	System Recovery	90%
	Feed Flow Range, per Train	1,650 to 1,900 gpm
	Feed Water pH	≥ 6.6
	Antiscalant Dose	2.4 - 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)
	COPCs and Background Water Quality	Document treatment performance
Decarbonator	Carbon Dioxide	≤ 12 mg/L in effluent
	Flow Rate	2,800 gpm (max)
	Liquid Loading Rate	29.6 gpm/ft ² (max)
Arcadia WTP Final Effluent (Arcadia Reservoir Effluent)	Organic Constituents	Exhibit 6, Table 3
	Inorganic Constituents	Exhibit 6, Table 4
	DDW Water Quality Standards	MCL _{eq} < 1 ^b
	pH	8.0 to 8.5
	Total Dissolved Solids	350 to 500 mg/L
	Turbidity	0.1 to 0.2 NTU
	Alkalinity	75 - 150 mg/L as CaCO ₃
	Fluoride	0.5 to 1.0 mg/L
	LSI	-1 to 1
CCPP	N/A. For informational purposes only	

a. Iron and manganese criteria concentrations are based on feed water quality requirements specified in RO Specifications 46 63 23 Section 2.01. The greensand filter was operated to achieve the City target greensand effluent concentrations of iron + manganese ≤ 0.06 mg/L.

b. Log removal criteria based on potential, future treatment plant influent concentrations.

MCL_{eq} = maximum contaminant level equivalent calculated by the sum of each contaminant in the fully treated water divided by its respective maximum contaminant level (MCL) or notification level (where applicable), which must be less than 1.

4.2 7-Day Acceptance Test Conditions

During the 7-day acceptance test period, the Arcadia WTP and Olympic AWTF was operated fully and in automatic mode for 7 consecutive days. New and modified unit processes and finished water were monitored and sampled daily to confirm operational and treatment performance. A summary of system flows and operational parameters is provided in Table 4-2. Test conditions were operated at steady state, and samples were collected at least 2 hours after initiation of new test conditions.

4.3 Source Water Quality Monitoring

Source water quality monitoring samples were collected for the Olympic Wells (S4) and the greensand effluent from the Charnock WTP (S7). Source water monitoring samples were collected daily for each test condition shown previously in Table 4-2. Water quality data collected are presented in Table 4-3 and Table 4-4.

This page intentionally left blank.

Table 4-2. 7-day Acceptance Test Conditions

a. 1,4-dioxane method (EPA 522) reporting and detection level higher than treated water samples (i.e., UV effluent or finished water) due to higher concentrations that require sample dilution.

b. Samples were not analyzed by the external laboratory, due to an internal miscommunication which led to the laboratory discarding collected samples. Hexavalent chromium concentrations for Olympic wells during the Performance Test are available in Table 2-4. Source water hexavalent chromium concentrations are low ranging from 0.00028-0.00089 mg/L and are not a contaminant of concern. Additional hexavalent chromium samples will be collected following permit amendment approval.

BMRL – sample result was below the method reporting limit.

H – analysis was performed outside the EPA recommended hold time.

M – sample was diluted prior to analysis due to high concentration or nature of matrix interferences. The MDL and MRL were raised due to the dilution.

	Vinyl Chloride	EPA 524.2	µg/L	0.5	BDLR	BDLR	BDLR	BDLR	BDLR	BDLR	BDLR

BDLR – sample result was below the DLR.

H – analysis was performed outside the EPA recommended hold time.

M – sample was diluted prior to analysis due to high concentration or nature of matrix interferences. The MDL and MRL were raised due to the dilution.

a. Recommended by the State Board; there is no official California DLR for 1,4-dioxane.

b. Samples were not analyzed by the external laboratory, due to an internal miscommunication which led to the laboratory discarding collected samples. Source water hexavalent chromium concentrations are low ranging from < 0.001 – 0.0024 mg/L and are not a contaminant of concern. Additional hexavalent chromium samples will be collected following permit amendment approval.

This page intentionally left blank.

4.4 Olympic AWTF Greensand System

The Olympic AWTF greensand filters were monitored during the 7-day acceptance test period to confirm pretreatment design specifications for the UV-AOP system are achieved. A summary of water quality and operational parameters is provided in the following sections.

4.4.1 Operational Monitoring

Greensand system monitoring was conducted to confirm operational systems meet specified design criteria. Throughout the duration of the 7-day acceptance test, Greensand filters 5A and 6A were online. Operating conditions at the time of sampling are summarized in Table 4-5. All operating parameters are within expected ranges.

Table 4-5. Operational Monitoring for Olympic AWTF Greensand Filters

Day/Date	Unit(s) in Operation		Flow Rate (gpm)		Loading Rate (gpm/ft ²)	
	Filter 5	Filter 6	Filter 5	Filter 6	Filter 5	Filter 6
Day 1 (2/12/24)	5A	6A	521	533	2.30	2.35
Day 2 (2/13/24)	5A	6A	540	510	2.38	2.25
Day 3 (2/14/24)	5A	6A	540	516	2.38	2.27
Day 4 (2/15/24)	5A	6A	532	510	2.34	2.25
Day 5 (2/16/24)	5A	6A	526	509	2.32	2.24
Day 6 (2/17/24)	5A	6A	522	479	2.30	2.11
Day 7 (2/18/24)	5A	6A	532	498	2.34	2.19

4.4.2 Water Quality Monitoring

The full suite of COPC water quality sampling was collected daily on the Olympic AWTF greensand effluent (S8). Results are summarized in Table 4-6. In addition, daily on-site water quality samples were collected and analyzed using field meters to confirm treatment performance. Field analysis results are presented in Table 4-7. Field tests were not conducted on Days 6 and 7, due to limited weekend staffing availability.

The Olympic greensand filters were able to achieve the goal of < 0.3 mg/L of total iron in the effluent for all days analyzed during the acceptance period. Except for Day 2, the Olympic greensand filters were also able to achieve the goal of < 0.05 mg/L of manganese in the effluent for all days. Note that the high reading of manganese on Day 2 is likely due to field contamination and/or instrumentation error, since the Olympic source water manganese concentrations were consistently, including Day 2, less than 0.01 mg/L. Additionally, effluent sampled at the same location the next day with same operating conditions indicated that the manganese goal was met and previous data (UV-AOP performance testing, see Table 2-5 for reference) was also consistently well below 0.05 mg/L.

Table 4-6. 7-day Acceptance Test Greensand Filter COPCs

4.4.3 Documentation of System or Equipment Failures or Outages

Table 4-8 provides a summary of failures or outages related to the Olympic AWTF greensand filter system.

Table 4-8. Failures or Outages for the Olympic AWTF Greensand Filter System

Item	Duration	Description
SM-9	Days 1-7	Offline for duration of 7-day acceptance test due to VFD issues. Capacity from the Olympic AWTF was limited to 1,000 gpm from SM-8 only.
Greensand Filter 5B	Days 1-7	Unable to be placed online during the 7-day acceptance test due to operational issues with existing filtrate valves.
Greensand Filter 6B	Days 1-7	Unable to be placed online during the 7-day acceptance test due to operational issues with existing filtrate valves.
Greensand effluent free chlorine analyzer	Days 1-7	Not connected to Historian. No SCADA data available for duration of 7-day acceptance test.
Greensand effluent turbidimeter	Days 1-7	Existing turbidimeter were not functional for the duration of 7-day test. Combined effluent field grab samples were collected and analyzed for turbidity. The primary treatment objects of the greensand filters are to provide iron and manganese removal for downstream processes (i.e., UV-AOP and FRRO). Turbidity is not a treatment objective for the greensand system and does not impact successful achievement of system performance criteria (i.e., greensand is not implemented to achieve disinfection credits through turbidity removal).

4.5 UV-AOP System

The UV-AOP system was monitored during the 7-day acceptance test to confirm the UV-AOP system meets design and treatment specifications. A summary of water quality and operational parameters is provided in the following sections.

4.5.1 Operational Monitoring

UV-AOP system monitoring was conducted to confirm operational systems meet specified design criteria. UV Train 2 was online throughout the duration of the 7-day acceptance test. Daily monitored system parameter readings at the time of sampling were recorded and are provided in Table 4-9. Operating conditions at time of sampling were within expected parameters. System parameters that were monitored continuously by SCADA and Historian are also provided as averages in the same table.

4.5.2 Water Quality Monitoring

The full suite of COPC water quality sampling was collected daily on the UV-AOP effluent (S10). Results are summarized in Table 4-10. The UV-AOP system was able to achieve all log removal goals outlined in the 7-day Acceptance Test Performance Criteria Table 4-1. In addition, daily on-site water quality samples were collected and analyzed using field meters to confirm treatment performance. Field analysis results are presented in Table 4-11.

All key water quality and parameter goals were met during the 7-day acceptance test period with all UV-AOP effluent samples below the method reporting limit for 1,4-dioxane, PCE, and TCE. Additionally, all predicted log removals achieved the compliance log removal targets of 2.4, 2.3, and 2.2 for 1,4-dioxane, PCE, and TCE, respectively.

a. The field crew was unsuccessful with the tri-iodide titration method, and field concentrations were not collected. System control center calculated data is reported here.

4.5.3 Documentation of System or Equipment Failures or Outages

Table 4-12 provides a summary of failures or outages related to the UV-AOP system.

Table 4-12. Failures or Outages for the UV-AOP System

Item	Duration	Description
UVT field meters	Day 3 & 4	Low UVT shutdown. Bubbles in the UVT field meter sample lines are suspected to be the cause of the shutdowns, and Trojan suggested installing a de-bubbler in the sample line. The system was able to be immediately restarted following the 20-minute off-spec and warmup periods. No further issues related to low UVT were encountered after installation of the de-bubbler through the remainder of the 7-day test, and there have since been no issues with bubbles causing low UVT shutdowns through the time of writing.

4.6 GAC System

The GAC system was monitored during the 7-day acceptance test to confirm the GAC system meets design and treatment specifications. A summary of water quality and operational parameters is provided in the following subsections.

4.6.1 Operational Monitoring

GAC system monitoring was conducted to confirm operational systems meet specified design criteria. Monitored system parameters are averaged for the day and summarized in Table 4-13.

4.6.2 Water Quality Monitoring

The full suite of COPC water quality sampling was collected daily on the GAC train lead vessel effluent (S23) and combined GAC effluent (S11). Results are summarized in Table 4-14. Additional on-site water quality samples were collected and analyzed daily to confirm treatment performance and quenching of H₂O₂. A summary of field water quality samples is provided in Table 4-15.

The GAC system quenched all hydrogen peroxide residual to non-detect for all test conditions during the 7-day acceptance test period. 1,4-Dioxane concentrations were measured in the GAC effluent samples despite being non-detect in the UV-AOP effluent (i.e., GAC feed). Further investigation

determined prior to the 7-day acceptance test, untreated UV-AOP water (i.e., 46-64 µg/L of 1,4-dioxane per Olympic well source water concentrations; Table 4-3) was loaded onto the GAC media while UV-AOP system functional and programming testing was conducted. Because 1,4-dioxane is not well adsorbed by GAC, it will initially adsorb to virgin carbon media when present in the feed water. Once the feed water concentration is reduced to non-detect (i.e., the UV-AOP system is operated), 1,4-dioxane will subsequently desorb (similar to nitrate) from the GAC media into the effluent stream. Thus, even though 1,4-dioxane was non-detect at the UV-AOP effluent during the 7-day acceptance test, it was detected above the DLR in the GAC effluent from some vessels. Despite 1,4-dioxane being detected in the GAC effluent, 1,4-dioxane concentrations were below DLR at the final plant effluent. All other COPCs were non-detect in the GAC effluent, except for 1,2,3-TCP on Day 6 at 0.011 µg/L. It is believed that this value is likely due to contamination.

The ability to operate any GAC trains without proper UV-AOP treatment will not be permitted during normal system operations moving forward. SCADA has been programmed with a permissive requiring the UV-AOP system to be operating and achieving treatment setpoints (i.e., log removals) for forward flow of water and operation of the GAC system; if the UV-AOP system is not meeting the required setpoints, the GAC system inlet valves will not open.

Following the results of the 7-day acceptance test, a flushing program (with UV-AOP treated water) has been initiated and the presence of 1,4-dioxane in the treated effluent is being tested to confirm it desists over time. The GAC vessels were flushed for an approximately 30-hour period in April 2024 and sampled for 1,4-dioxane. Results following the first flushing program with treated UV-AOP water are included in Table 4-16. 1,4-Dioxane was below DLR for trains 3 and 4 in both lead and lag vessels. Trains 1 and 2 were below DLR in the lead vessels, but above the DLR in the lag vessels; the mass transfer zone for 1,4-dioxane has moved from the lead vessel through to the lag vessel. An additional 60-hour flushing period is planned to commence in May 2024 with 1,4-dioxane samples at lead and lag effluent sample locations and across the lag vessel carbon bed (i.e., 40%, 60%, 80% bed depth). Flushing will continue until sampling confirms that all vessels are below the DLR. This data will be included in the final report.

Table 4-13. Operational Monitoring for GAC System

Parameter	Monitoring Type	Day 1 (2/12/24)	Day 2 (2/13/24)	Day 3 (2/14/24)	Day 4 (2/15/24)	Day 5 ^b (2/16/24)	Day 6 (2/17/24)	Day 7 (2/18/24)

4.6.3 Documentation of System or Equipment Failures or Outages

Table 4-17 provides a summary of failures or outages related to the GAC system.

Table 4-17. Failures or Outages for the GAC System

Item	Duration	Description
GAC Train 4	Day 5	Offline on 2/16/2024 due to an influent valve requiring repair.
GAC Train 2	Day 5	Shutdown on 2/16/2024 due to high feed pressure.
GAC Trains 1, 3, and 4	Days 1-7	It was discovered on 2/18/2024 that the lead and lag vessels were unintentionally switched for Trains 1, 3, and 4, and configuration was kept as is for the entire duration of the 7-day acceptance test. Train 2 was operated as intended with the A vessel as the lead and the B vessel as the lag through the entire 7-day acceptance test. Results in the above tables have been matched appropriately.
GAC differential pressure transmitters	Days 1-7	Differential pressure readings were inaccurate throughout the 7-day acceptance test due to calibration issues. Vendor calibrated transmitters following the acceptance test period.

4.7 RO System

The RO system was monitored during the 7-day acceptance test to confirm the RO system meets design and treatment specifications. A summary of water quality and operational parameters is provided in the following sections.

4.7.1 Operational Monitoring

RO system monitoring was conducted to confirm operational systems meet specified design criteria. Different RO trains were placed online per test conditions outlined in Table 4-2 (7-day Acceptance Test Conditions). All RO trains were operated in flow reversal mode at 90 percent recovery and 1,900 gpm feed flow. For the duration of the duration of the test period, pH was above 6.6 and antiscalant (Vitec 4000) was dosed at 4.5 mg/L. The RO bypass flows were adjusted to target a finished water conductivity of approximately 300 µS/cm. Bypass flows and other monitored RO feed parameters were averaged per test condition and are presented in the Table 4-18. Note that an additional RO

bypass evaluation will be conducted following the 7-day acceptance test to analyze how various bypass flow scenarios affect final effluent water quality. Normalized data was calculated using formulas provided by the RO membrane manufacturer, Toray, with initial startup data used as the baseline condition. Normalization equations used in the TorayTrak software are listed below.

Normalized Feed Pressure

$$P_{Norm} = P_{actual} * \frac{TCF_{ref}}{TCF_{actual}}$$

Where P_{Norm} = normalized feed pressure, in psi

P_{actual} = actual feed pressure, in psi

TCF_{ref} = temperature correction factor at reference (baseline) conditions

TCF_{actual} = temperature correction factor at actual conditions

TCF is calculated using the following formula:

$$TCF = \frac{\exp\left(\frac{1965}{298.15}\right)}{\exp\left(\frac{1965}{T + 273.15}\right)} * (\exp(0.0107 * (T - 25)))$$

Where T = temperature, in °C

Normalized Permeate Flow

$$Q_{Norm} = Q_{actual} * \frac{TCF_{ref}}{TCF_{actual}} * \frac{NDP_{ref}}{NDP_{actual}}$$

Where Q_{Norm} = normalized permeate flow, in gpm

Q_{actual} = actual permeate flow, in gpm

TCF_{ref} = temperature correction factor at reference (baseline) conditions

TCF_{actual} = temperature correction factor at actual conditions

NDP_{ref} = net driving pressure at reference (baseline) conditions, in bar

NDP_{actual} = net driving pressure at actual conditions, in bar

TCF is calculated using the same formula outlined previously.

NDP is calculated using the following formula:

$$NDP = P_{feed} - \frac{P_{DP}}{2} - P_{perm} - (\pi_{feed-brine} - \pi_{perm})$$

Where P_{feed} = feed pressure, in bar

P_{DP} = overall (system) differential pressure, equal to the sum of stage 1-3 dP, in bar

P_{perm} = permeate pressure, in bar

$\pi_{feed-brine}$ = feed-brine osmotic pressure, in bar

π_{perm} = permeate osmotic pressure, in bar

Osmotic pressures (π) are calculated using the following formulas:

$$\pi = 1.0137 * 0.082504 * \frac{T + 273.15}{1000} * 10 \left(\frac{-0.5 * \left(\frac{\left(\frac{1}{2} * \left(\frac{TDS}{1000} * \frac{58.44}{2} * 1000 \right) * 4 \right)}{2000} \right) + \left(\frac{1}{2} * \left(\frac{TDS}{1000} * \frac{58.44}{2} * 1000 \right) * 4 \right)}{2000} \right)^{0.14} * \frac{TDS}{1000} * \frac{58.44}{2} * 2000$$

Where TDS = log mean average of the feed and brine TDS for feed-brine osmotic pressure and permeate TDS for permeate osmotic pressure.

Normalized Specific Flux

$$SF = \frac{Q_{perm} * \frac{1440}{(17,904.13 * 10.76)}}{P_{feed} - P_{perm}}$$

Where SF = specific flux, in gfd/psi

Q_{perm} = permeate flow, in gpm

P_{feed} = feed pressure, in psi

P_{perm} = permeate pressure, in psi

Normalized Salt Passage

$$SP_{norm} = \left(SP_{actual} * \frac{Q_{perm,actual}}{Q_{perm,ref}} * \frac{TCF_{salt,ref}}{TCF_{salt,actual}} * \frac{LM_{feed-brine,ref}}{LM_{feed-brine,actual}} * \frac{TDS_{feed,actual}}{TDS_{feed,ref}} \right) * 100\%$$

Where SP_{norm} = normalized salt passage, in %

SP_{actual} = actual salt passage, in %, calculated by dividing permeate TDS by the log mean average of the feed-brine TDS

Q_{perm, actual} = permeate flow at actual conditions, in gpm

Q_{perm, ref} = permeate flow at reference (baseline) conditions, in gpm

TCF_{salt, ref} = temperature correction factor for salts at reference condition

TCF_{salt, actual} = temperature correction factor for salts at actual condition

LM_{feed-brine, ref} = log mean average of the feed and brine TDS at reference condition

LM_{feed-brine, actual} = log mean average of the feed and brine TDS at actual condition

TDS_{feed, actual} = feed TDS at actual condition

TDS_{feed, ref} = feed TDS at reference condition

TCF_{salt} is calculated using the below formula:

$$TCF_{salt} = \exp(0.0331 * (T - 25))$$

Where T = temperature in °C

Table 4-19, Table 4-20, and Table 4-21 provide a summary of the averaged monitored system values for each respective train.

4.7.2 Water Quality Monitoring

The full suite of COPC water quality sampling was collected daily on the RO Feed (S14) and RO combined permeate (S24). Results are summarized in Table 4-22. RO feed water quality was also monitored in the field during the acceptance test period. Field analysis results and average feed water quality data are presented in Table 4-23.

1,4-Dioxane was measured in the RO feed, due to the GAC desorption from Olympic AWTF-treated water and a low concentration in the Charnock Wells source water. 1,4-Dioxane rejection by the RO membranes was approximately 90%, which exceeded the 80% rejection predicted in the Step 4 report. The 1,4-Dioxane concentration in the RO permeate was reduced to below the DLR. Additionally, TCE was measured in the RO feed contributed by the 4-15 µg/L in the Charnock WTP source water (Table 4-4). As expected, TCE is not well removed by RO, resulting in minimal to no appreciable removal in the RO permeate. Although the concentration of TCE in the Charnock WTP source water was above the values used in the initial and contingency design estimated in the Step 4 report, TCE concentrations in the finished water was reduced to below the DLR for 6 of the 7 days and below the MCL for all 7 days, as described in Section 4.9.

Table 4-18. Operational Monitoring for RO Feed System

Parameter	Monitoring Type	Day 1 (2/12/24)	Day 2 (2/13/24)	Day 3 (2/14/24)	Day 4 (2/15/24)	Day 5 (2/16/24)	Day 6 (2/17/24)	Day 7 (2/18/24)
Trains in Operation	-	3,4	2,3	2,4	2,3,4	3,4	2,4	2
Total RO Feed Flow Rate (gpm)	Online	3,800	3,800	3,800	5,700	3,800	3,800	1,900
RO Bypass Flow (gpm) ^a	Online	760	760	760	1,140	760	575	439
RO Bypass Setpoint (%)	Online	20%	20%	20%	20%	20%	15%	23%
Sulfuric Acid Pump Speed (%) ^b	Online	68%	69%	75%	26%	52%	26%	26%
Antiscalant Pump Speed (%)	Online	28%	30%	28%	44%	27%	26%	15%

a. RO Bypass setpoint is calculated as the quotient of RO bypass flow and RO feed demand on SCADA.

b. The sulfuric acid pump speeds presented here are the daily average of the VFD speeds automatically adjusted by the PLC to maintain a pH setpoint of 6.6. Note that the PLC also automatically increases pump stroke when more RO trains are placed online. Depending on the pump curve, pump speeds may not necessarily increase with more RO trains online. In addition, the required sulfuric acid pump speeds decreased following sulfuric acid dilution panel repairs on Day 3. Refer to Section 4.7.3 for more details.

gpm = gallons per minute

a. Duplicate samples were collected during Day 6. Results shown are an average of reported concentrations.

b. Recommended by the State Board; there is no official California DLR for 1,4-dioxane.

BDLR – sample result was below the DLR.

This page intentionally left blank.

Table 4-23. Online Feed Water Quality Data and Field Analysis Results for RO System

Parameter	Monitoring Type	Day 1 (2/12/24)	Day 2 (2/13/24)	Day 3 (2/14/24)	Day 4 (2/15/24)	Day 5 (2/16/24)	Day 6 (2/17/24)	Day 7 (2/18/24)
RO Feed SDI (S14)	Field Analysis	1.38	1.55	1.42	1.45	1.31	-.b	-.b
RO Feed ORP (M) [eV]	Online	565	578	576	575	573	561	571
RO Feed Turbidity (M) [NTU]	Online	0.099	0.078	0.096	0.057	0.063	0.062	0.060
RO Feed Ammonia Residual (K) [mg/L] ^a	Online	N/A	N/A	N/A	N/A	N/A	N/A	N/A
RO Feed Chloramine Residual (K, N) [mg/L] ^a	Online	N/A	N/A	N/A	N/A	N/A	N/A	N/A
RO Feed Chlorine to Ammonia, N Ratio (K) [mg/L] ^a	Online	N/A	N/A	N/A	N/A	N/A	N/A	N/A
RO Feed Temperature(N) [°F]	Online	45.5	45.0	45.3	45.2	45.6	45.4	45.4
RO Feed pH (M)	Online	6.6	6.6	6.6	6.7	6.6	6.6	6.6
RO Feed Conductivity (M) [µS/cm]	Online	1,394	1,459	1,457	1,452	1,427	1,393	1,440
RO Feed Free Chlorine Residual (M) [mg/L]	Online	0.83	0.85	0.82	0.77	0.76	0.62	0.59

a. Monochloramine, ammonia, and chlorine-to-ammonia ratio readings were not available at location K due to unavailability of analyzer reagents. Chloramine residual is provided at location N.

b. Field tests were not conducted on Days 6 and 7 due to staffing availability from Brown and Caldwell.

4.7.3 Documentation of System or Equipment Failures or Outages

Table 4-24 provides a summary of failures or outages related to the RO system.

Table 4-24. Failures or Outages for the RO System

Item	Duration	Description
All online RO trains	Day 3	RO system was automatically shut down six times due to programmed shutdown conditions, including high pH, for a total of 2.5 hours of downtime. The RO system was manually shut down for an additional hour on the same day to troubleshoot and repair issues relating to pH controls. It was discovered that the sulfuric acid dilution panel static mixer had mechanical issues, impeding sulfuric acid flow to the RO feed injection. Short-term repairs were completed, and dilution flows were also adjusted to help stabilize pH controls.
All online RO trains	Day 4	Following completion of the Day 4 test condition sampling on 2/15/24, the RO system was manually shut down for an additional 2 hours to allow the Contractor to complete permanent repairs on the sulfuric acid dilution panel static mixer. Following repairs, RO feed pH was stable throughout the remaining duration of the acceptance test period.
High-Pressure RO Feed Pump 4	Day 7	The variable-frequency drive (VFD) on the existing High-Pressure RO Feed Pump 4 faulted, and RO Train 4 was unable to be turned on. Repairs were completed the next day. This did not affect the Day 7 test conditions since the test condition only required one RO train to be online. RO Train 2 was subsequently placed online at the same flow and recovery rate for sampling.
RO Feed Tank Monochloramine and Ammonia Analyzer	Days 1-7	Not functional for the acceptance test due to insufficient reagent levels. Reagents were purchased and replaced following the acceptance test period. Total chlorine analyzers were used to monitor chloramine residuals.

4.8 Decarbonation System

The decarbonation system was monitored during the 7-day acceptance test to document the system operating conditions. Water quality samples were collected at the decarbonator effluent to document treatment performance. A summary of operational and water quality parameters is provided in the following subsections.

4.8.1 Operational Monitoring

The decarbonation system was monitored to document operational conditions. Monitored parameters are summarized in Table 4-25.

Table 4-25. Operational Monitoring for Decarbonation System								
Parameter	Monitoring Type	Day 1 (2/12/24)	Day 2 (2/13/24)	Day 3 (2/14/24)	Day 4 (2/15/24)	Day 5 (2/16/24)	Day 6 (2/17/24)	Day 7 (2/18/24)
Trains in Operation	Field Reading	1/2	1/2	1/2	1/2	1/2	1/2	1/2
Flow Rate (gpm)	Online	4,232	4,121	3,563	5,630	4,272	4,193	2,174
Liquid Loading Rate (gpm/ft ²)	Calculation	22.3	21.7	18.8	29.7	22.5	22.1	11.5
Blower Speed (rpm) ^a	Field Reading	2,295	2,295	2,295	2,295	2,295	2,295	2,295

a. Blowers on SCADA do not quantify speed and read as a running status with only TRUE or FALSE outputs.

4.8.2 Water Quality Monitoring

The full suite of COPC water quality sampling was collected daily on the decarbonator influent (S18) and decarbonator effluent (S19). Results are summarized in Table 4-26. All COPCs were below the DLR in the decarbonator feed, except for TCE at 2.7 to 4.4 µg/L. The decarbonator reduced TCE to below the reporting limit for all test conditions, except for Day 1 at 0.57µg/L, which is well below the MCL of 5 µg/L.

Table 4-26. 7-Day Acceptance Test Decarbonator COPCs																	
Parameter	Method	Unit	DLR	Day 1 (2/12/2024)		Day 2 (2/13/2024)		Day 3 (2/15/2024)		Day 4 (2/15/2024)		Day 5 (2/16/2024)		Day 6 (2/17/2024)		Day 7 (2/18/2024)	
				Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)	Feed (S18)	Effluent (S19)

4.8.3 Documentation of System or Equipment Failures or Outages

Table 4-27 provides a summary of failures or outages related to the decarbonation system.

Table 4-27. Failures or Outages for the Decarbonation System		
Item	Duration	Description
Decarbonator Train 3	Days 1-7	Out of service for the duration of the 7-day acceptance test pending Air Quality Management District permit to place the train into service. Trains 1 and 2 were sufficient to produce finished water for all test conditions.

4.9 Arcadia WTP Final Effluent

The Arcadia WTP final effluent water quality was monitored daily for each test condition to confirm final water quality requirements were met. Water quality samples were collected post-Arcadia reservoir (S22). Water quality parameters included COPCs, background water quality, and all applicable DDW drinking water standards.

4.9.1 Water Quality Monitoring

The full suite of COPC water quality sampling, background water quality, and DDW drinking water standards was collected daily at the finished water (S22). Results are summarized in Table 4-28 through . Background water quality, COPCs, secondary drinking water standards, and compounds with notification levels are reported to their method reporting limits (Table 4-28, ,). DDW regulated compounds are reported to the DLR for the purpose of compliance reporting (Table 4-29, Table 4-30, , , ,).

Additional onsite water quality samples were collected and analyzed daily to confirm treatment performance. A summary of finished water quality is provided in Table 4-36.

This page intentionally left blank.

a. Samples were not analyzed by the external laboratory, due to an internal miscommunication which led to the laboratory discarding collected samples. Hexavalent chromium concentrations for Olympic wells during the Performance Test are available in Table 2-4. Source water hexavalent chromium concentrations are low ranging from 0.00028-0.00089 mg/L and are not a contaminant of concern. Additional hexavalent chromium samples will be collected following permit amendment approval.

H – analysis was performed outside the EPA recommended hold time.

MFL = million fibers per liter

Table 4-39. Arcadia WTP Major Effluent Water Quality Performance Parameters (Exhibit 6, Table 5)

Parameter	Target Value	Range								Notes
			Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7	
pH	8.3	8.0 to 8.5	8.4	8.4	8.6	8.3	8.5	8.7	8.8	pH exceeded target finished water pH on three days (Day 3, Day 6, Day 7). Additional RO bypass evaluations will be conducted to achieve target values.
TDS (Final Effluent)	400	350 to 500	240	210	190	150	190	160	200	Final effluent TDS was below the target TDS value. Additional RO bypass evaluations will be conducted to achieve target values.
TDS (RO Permeate)	< 120	-	-	-	-	-	-	-	-	TDS was not analyzed at RO permeate during the 7-day acceptance test. TDS results from the FRRO performance test ranged from 17 – 34 mg/L in the RO permeate (Table 3-5).
Turbidity (NTU)	< 0.2	0.1 to 0.2	0.2	0.2	0.2	0.2	0.2	0.2	0.2	Turbidity target was achieved.
Alkalinity (mg/L as CaCO ₃)	100	75 to 150	97	96	84	63	84	71	86	Day 4 and 6 alkalinity was below target value. Additional RO bypass evaluations will be conducted to achieve target values.
Fluoride (mg/L)	1.0	0.5 to 1.0	0.82	0.82	0.86	0.82	0.83	0.82	0.83	Fluoride target was achieved.
LSI (20 C)	0.0	-1.0 to 1.0	0.4	0.4	0.5	0.0	0.4	0.4	0.7	Achieved target range.
CCPP (mg/L as CaCO ₃)	-	-	4.1	3.5	4.3	0.0	3.2	3.0	6.1	No City target but will be monitored during RO bypass evaluation.
Aggressive Index (AI)	-	11 to 13	12.2	12.2	12.3	11.8	12.2	12.2	12.5	Achieved target range specified by City email on 5/29/2024.

4.9.2 Documentation of System or Equipment Failures or Outages

Table 4-40 provides a summary of failures or outages related to the finished water.

Item	Duration	Description
Arcadia Wells	Days 1-7	Not online for the duration of the acceptance test.
Finished water chloramine and ammonia residual analyzer	Days 1-7	Not functional for the acceptance test, pending reagents to be purchased by the City.

4.10 Deviations from Acceptance Test Plan

The following deviations were noted during the 7-day acceptance test and were reported to and approved by the City upon initial findings:

1. Arcadia Wells were offline for the duration of the 7-day acceptance test due to insufficient time to bring the wells back online (requires chlorination, flushing, and bacteriological absent sample).
2. Olympic Well SM-9 was offline for the duration of the 7-day acceptance test due to VFD issues. Capacity from the Olympic AWTF was limited to 1,000 gpm from SM-8 only.
3. Due to miscommunication with the lab and system/equipment failures or outages documented above, several test conditions 1, 2, 3, 4, and 6 had to be recreated during the acceptance test period to collect missing samples. As such, continuous operation of testing was interrupted for 2/15 through 2/18 and restarted as soon as issues were resolved. See below for further discussion on plant outages.
4. Field water quality monitoring was not conducted during the weekends due to staffing availability from Brown and Caldwell. City is not responsible for the results of any monitoring during this period.
5. The following analyzers and meters were not functional or not available in Historian. Grab samples and/or manual field meter readings were used to determine performance and water quality.
 - a. Greensand effluent free chlorine (not in Historian, expected non-detect as chlorine added pre-greensand would be quenched by the H₂O₂ dosed in great excess).
 - b. Greensand effluent turbidity (not functional).
 - c. GAC pressure differential indicator transmitter not functional.
 - d. RO feed monochloramine and ammonia analyzer at RO feed tank (K) (not reading correctly due to missing reagents).
 - 1) Finished water monochloramine residual (not functional due to missing reagents).
 - 2) Finished water ammonia-to-chlorine ratio (not functional due to missing reagents).
6. A bump sequence on the GAC was not conducted and was deferred to after 7-day testing.
7. Antiscalant dose was increased to 4.5 parts per million (from the indicated 2.4 to 3.5 in the Test Plan) to help mitigate scaling at the brine system.

The total duration of outages during the 7-day acceptance test period was approximately 6.2 hours due to low UVT shutdowns (Section 4.5.3) and RO shutdowns (Section 4.7.3), with the longest single outage period lasting approximately 3.5 hours.

4.11 Operational and Treatment Performance Compliance

A summary of the 7-day acceptance test operational and treatment performance compliance is provided in Table 4-41. Treatment performance compliance criteria were achieved for the greensand, UV-AOP, GAC, FRRO, and decarbonator treatment systems. All Arcadia final effluent samples achieved primary MCLs, secondary MCLs, action levels, notification levels, and a COPC MCLeq of less than 1.

Arcadia specific finished water performance criteria were achieved for inorganic constituents (Exhibit 6, Table 4) and organic constituents (Exhibit 6, Table 3), except for a detection of TCE at 0.56 µg/L on Day 1. TCE concentrations observed in the RO feed water were contributed by Charnock WTP source water with all Olympic GAC effluent samples being non-detect. Arcadia specific finished water performance criteria were achieved for inorganic constituents (Exhibit 6, Table 4) and organic constituents (Exhibit 6, Table 3), except for a detection of TCE at 0.56 µg/L on Day 1. TCE concentrations observed in the RO feed water were contributed by Charnock WTP source water with all Olympic GAC effluent samples being non-detect. Some effluent water quality performance parameters (Exhibit 6, Table 5) were not achieved for all sample days. The bypass percentage used during the Acceptance Test was based on a conductivity limit of 300 µS/cm and the blend ratio was lower than may be used during long term operation—the TDS was below the target range all seven days and alkalinity was below the target range on two of the seven days at the bypass percentage used during the 7-Day test. The treated water pH was above the target range for three of the seven days. The Design-Builder will develop an additional, more detailed water quality profile of a range of bypass blend scenarios during the 30-day test following permit amendment approval by the DDW to demonstrate the system's ability to consistently meet the range of water quality goals described in Table 4-40 and Exhibit 6.

Table 4-41. 7-day Acceptance Test Performance Criteria

System	Parameter	Criteria	Compliance
Greensand	Iron ^a	≤ 0.3 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^b
	Manganese ^a	≤ 0.05 mg/L in effluent (Target combined Fe, Mn ≤ 0.06 mg/L)	Achieved ^b
UV-AOP	1,4-Dioxane	≥ 2.4 log removal	Achieved
	TCE	≥ 2.2 log removal	Achieved
	PCE	≥ 2.3 log removal	Achieved
	Total flow	2,000 gpm	Achieved
	UVT	≥ 96%	Achieved
	UV System Power	329 kW	Final Trojan report pending ^c
GAC	H ₂ O ₂ Dose	Maximum H ₂ O ₂ dose of 40 mg/L	Achieved
	H ₂ O ₂	Quench residual H ₂ O ₂ to non-detect	Achieved
	COPCs	Document treatment performance	Achieved
	Loading Rate	≤ 5.9 gpm/ft ²	Achieved
	EBCT	≥ 5 minutes	Achieved
	Headloss	≤ 10-inch w.c./ft bed depth	Achieved

Table 4-41. 7-day Acceptance Test Performance Criteria

System	Parameter	Criteria	Compliance
FRRO	System Recovery	90%	Achieved
	Feed Flow Range, per Train	1,650 to 1,900 gpm	Achieved
	Feed Water pH	≥ 6.6	Achieved
	Antiscalant Dose	2.4 - 4.5 mg/L (Avista Vitec-4000) or 0.8 to 1.2 mg/L (AWC A-119)	Achieved
	COPCs	Document treatment performance	Achieved
Decarbonator	Carbon Dioxide	≤ 12 mg/L in effluent	Achieved
	Flow Rate	2,800 gpm (max)	Achieved
	Liquid Loading Rate	29.6 gpm/ft ² (max)	Achieved
Arcadia WTP Final Effluent (Arcadia Reservoir Effluent)	Organic Constituents	Exhibit 6, Table 3	Achieved ^d
	Inorganic Constituents	Exhibit 6, Table 4	Achieved
	DDW Water Quality Standards	MCL _{eq} < 1	Achieved
	pH	8.0 to 8.5	Achieved for 4 of the 7 days. Design-build team will refine pH control to demonstrate the system's ability to consistently operate within the target pH range
	Total Dissolved Solids	350 to 500 mg/L	TDS was below the target range at the bypass percentage used during the 7-Day test. Design-build team will develop a profile of a range of bypass blend scenarios. This information will be used to select a bypass target range for operations that meets the TDS goal.
	Turbidity	0.1 to 0.2 NTU	Achieved
	Alkalinity	75 - 150 mg/L as CaCO ₃	Day 5 and Day 6 were below target alkalinity at the bypass percentage used during the 7-Day test. Design-build team will develop a profile of a range of bypass blend scenarios. This information will be used to select a bypass target range for operations that meets the alkalinity goal.
	Fluoride	0.5 to 1.0 mg/L	Achieved
	LSI	-1.0 to 1.0 ^e	Achieved
	CCPP	N/A ^e	N/A. For informational purposes only
	Al	11 - 13 ^e	Achieved

- a. Iron and manganese criteria concentrations are based on feed water quality requirements specified in RO Specifications 46 63 23 Section 2.01. The greensand filter was operated to achieve the City target greensand effluent concentrations of iron + manganese ≤ 0.06 mg/L.
- b. Field sample results for day 2 did not achieve the target combined iron and manganese concentration but were identified as sample contamination or analytical error, due to subsequent sample results and Olympic source water concentrations being well below measured greensand concentrations.
- c. All organic treated water quality requirements were achieved during the 7-day acceptance test, except for TCE on Day 1. High TCE concentrations were contributed from Charnock WTP source water and not Olympic AWTF with all samples below MRL in the GAC effluent samples.
- d. Design log removal goals were achieved at design operating conditions. Final Trojan power measurements pending.
- e. LSI and CCPP revised, Al added as deviation from Exhibit 6 to match permit requirements per City directive received on 5/29/24. MCL_{eq} = maximum contaminant level equivalent calculated by the sum of each contaminant in the fully treated water divided by its respective maximum contaminant level (MCL) or notification level (where applicable), which must be less than 1.

*PLC fan was not on during PT-UV9 at UV feed sample location.

*Prior to PT-UV10, the H2O2 injection line broke forcing immediate shutdown of the UV system. After replacing the H2O2 line, the UV system would not communicate with the feed flow meter (i.e., read zero flow), which would not allow the UV system to operate in Auto mode (lamps would not turn on, because it was reading zero flow). Due to limited well operation time (well shutdown at 2:30 pm), we conducted condition 10 in manual mode following the UV lamp and H2O2 setpoints conducted for condition 12.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/21/23 with the Chain-of-Custody document. The samples were received in good condition, at 14.8 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
J	Estimated conc. detected <MRL and >MDL.
O-08	The original extraction and/or analysis of this sample yielded QC recoveries outside acceptance criteria. It was re-extracted/re-analyzed after the recommended maximum hold time.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/22/23 with the Chain-of-Custody document. The samples were received in good condition, at 20.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
_>=740	>=740
A-01	using default temperature at 20C
J	Estimated conc. detected <MRL and >MDL.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/22/23 with the Chain-of-Custody document. The samples were received in good condition, at 20.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
O-08	The original extraction and/or analysis of this sample yielded QC recoveries outside acceptance criteria. It was re-extracted/re-analyzed after the recommended maximum hold time.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/22/23 with the Chain-of-Custody document. The samples were received in good condition, at 20.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/25/23 with the Chain-of-Custody document. The samples were received in good condition, at 1.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 9/25/23 with the Chain-of-Custody document. The samples were received in good condition, at 1.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
QC-2	This QC sample was reanalyzed to complement samples that require re-analysis on different date. See analysis date.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/02/23 with the Chain-of-Custody document. The samples were received in good condition, at 9.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
R-01	The MDL and/or MRL for this analyte has been raised to account for matrix interference.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/02/23 with the Chain-of-Custody document. The samples were received in good condition, at 9.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
<u>>=740</u>	>=740
A-01	Using default tetperature 20C for calculation
J	Estimated conc. detected <MRL and >MDL.
M-05	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/03/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
>=740	>=740
J	Estimated conc. detected <MRL and >MDL.
M-05	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

WECK LABORATORIES, INC.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/03/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
R-01	The MDL and/or MRL for this analyte has been raised to account for matrix interference.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/03/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 2.2 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
A-01	Using default temperature 20C for calculation
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
J	Estimated conc. detected <MRL and >MDL.
M-05	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-ME	Acceptable QC with marginal exceedance
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 9.8 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
R-01	The MDL and/or MRL for this analyte has been raised to account for matrix interference.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.
Analytical Laboratory Services - Since 1964

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
*	The recommended holding time for this analysis is only 15 minutes. The sample was analyzed as soon as it was possible but it was received and analyzed past holding time.
_>=740	>=740
A-01	Using default temperature 20 C for calculation
J	Estimated conc. detected <MRL and >MDL.
M-05	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
O-15	The sample was received with the recommended holding time nearly expired. It was analyzed as soon as possible but the maximum holding time was slightly exceeded.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	A result of ND for odor corresponds to No Odor Observed
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	MDL raised due to low sensitivity
A-01a	Surrogate recovery is outside of control limit. The data was accepted since all target analytes were non detected.
J	Estimated conc. detected <MRL and >MDL.
O-15	The sample was received with the recommended holding time nearly expired. It was analyzed as soon as possible but the maximum holding time was slightly exceeded.
Q-ME	Acceptable QC with marginal exceedance
S-BS	Surrogate recovery outside of control limits for LCS. The data was accepted based on valid recovery of the target analytes.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.
Analytical Laboratory Services - Since 1964

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/06/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/03/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/06/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/03/23 with the Chain-of-Custody document. The samples were received in good condition, at 18.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 5.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 5.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD results exceeded the QC control limits. The batch was accepted based on acceptable BS recovery.
J	Estimated conc. detected <MRL and >MDL.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-11	This analyte is low bias in QC samples, sample result is suspect.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 5.0 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD results exceeded the QC control limits. The batch was accepted based on acceptable BS recovery.
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
E-01	The concentration indicated for this analyte is an estimated value above the calibration range.
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-11	This analyte is low bias in QC samples, sample result is suspect.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/06/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD result exceeded the QC control limits. The batch was accepted based on acceptable LCSD & CCVs.
A-01a	The RPD results exceeded the QC control limits. The batch was accepted based on acceptable BS recovery.
B-02	This analyte is detected in the method blank below the MRL, but above the method acceptance criteria.
J	Estimated conc. detected <MRL and >MDL.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-11	This analyte is low bias in QC samples, sample result is suspect.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/04/23 with the Chain-of-Custody document. The samples were received in good condition, at 22.1 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD result exceeded the QC control limits. The batch was accepted based on acceptable LCSD & CCVs.
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
R-01	The MDL and/or MRL for this analyte has been raised to account for matrix interference.
S-GC	Surrogate recovery outside of control limits due to a possible matrix effect. The data was accepted based on valid recovery of the remaining surrogate.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD result exceeded the QC control limits. The batch was accepted based on acceptable LCSD & CCVs.
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Project Manager: Brown & Caldwell

Notes and Definitions

Item	Definition
A-01	The RPD result exceeded the QC control limits. The batch was accepted based on acceptable LCSD & CCVs.
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	The RPD result exceeded the QC control limits. The batch was accepted based on acceptable LCSD & CCVs.
J	Estimated conc. detected <MRL and >MDL.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/09/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation and/or analysis. The MDL and MRL were raised due to this dilution.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.
Analytical Laboratory Services - Since 1964

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Weck Laboratories, Inc.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
Q-ME	Acceptable QC with marginal exceedance
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Brown & Caldwell,

Enclosed are the results of analyses for samples received 10/05/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.9 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.
